Lecture 11
Planning - III - Configuration Spaces

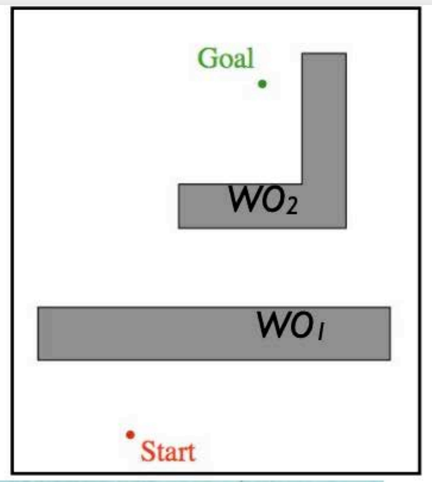
Course Logistics

- **Quiz 5 was posted yesterday and was due today at noon.**
- Project 4 was posted on 02/19 and will be due on 03/05.
  - Start early!
- Come to Karthik's OH if you want to discuss
  - Final project ideas
  - Getting involved in research

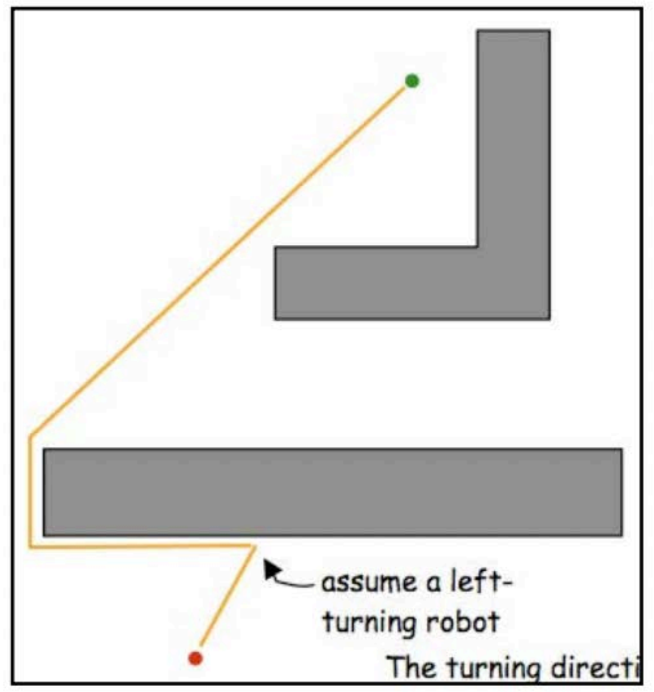
Previously

Bug Algorithms

- Assume bounded world W
- Known: global goal
  - measurable distance $d(x,y)$
- Unknown: obstacles WO_i
- Local sensing
  - tactile
  - distance traveled



Bug 0

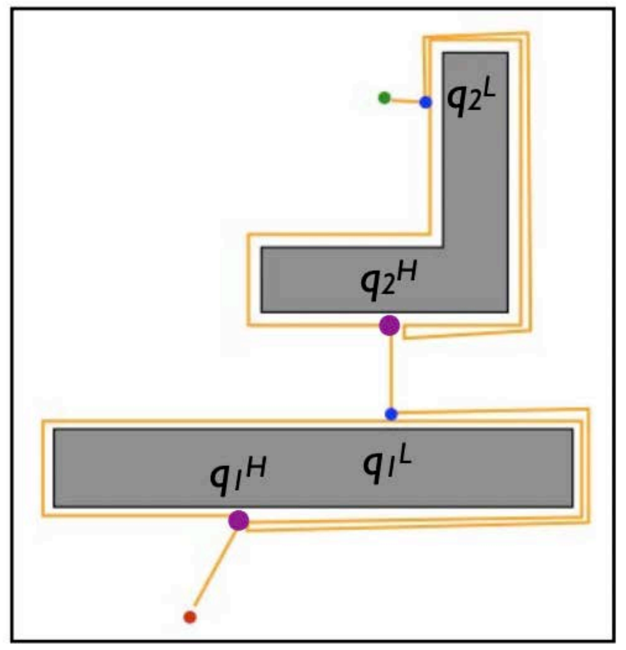


1) Head towards goal

2) When hit point set, follow wall, until you can move towards goal again (leave point)

3) continue from (1)

Bug 1



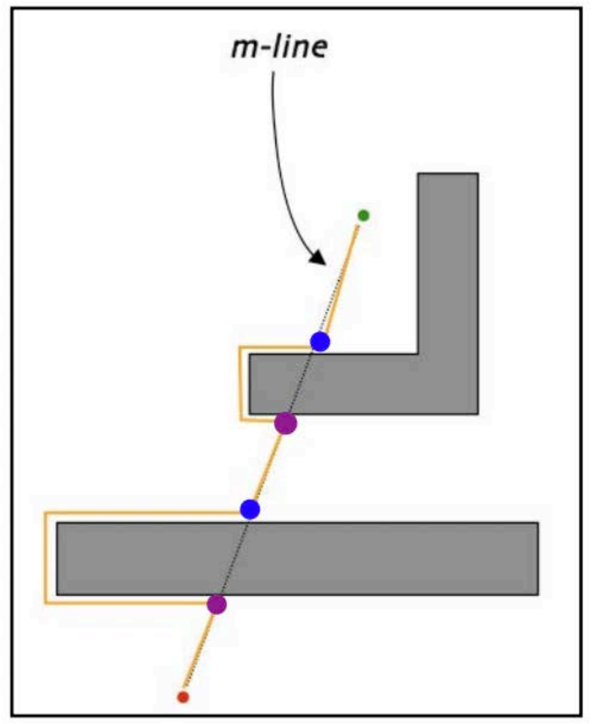
1) Head towards goal

2) When hit point set, circumnavigate obstacle, setting leave point as closest to goal

3) return to leave point

4) continue from (1)

Bug 2



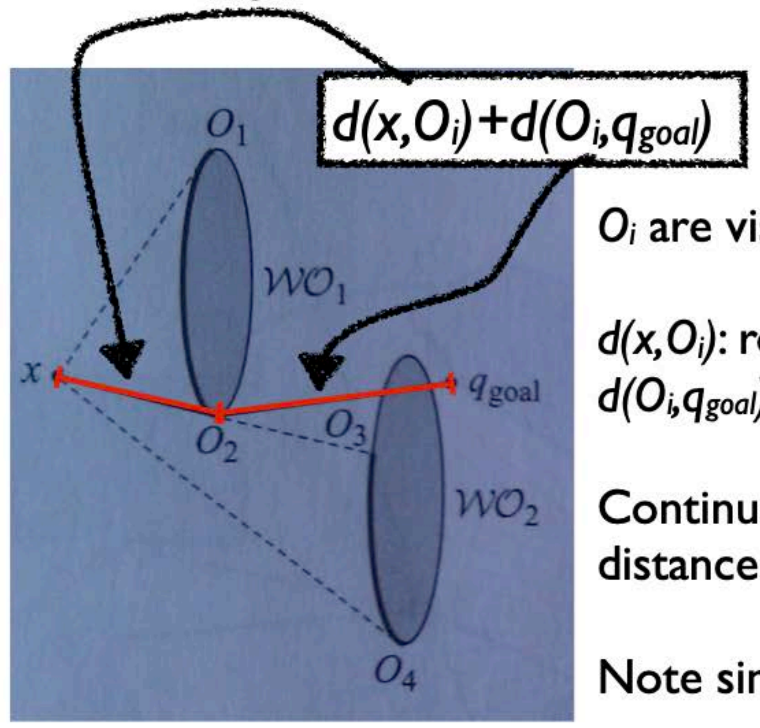
1) Head towards goal on m-line

2) When hit point set, traverse obstacle until m-line is encountered

3) set leave point and exit obstacle

4) continue from (1)

Tangent Bug: Heuristic Distance-to-Goal



O_i are visible obstacle extents

$d(x,O_i)$: robot can see

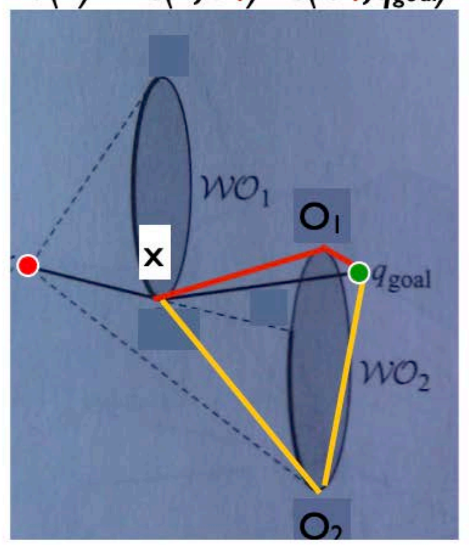
$d(O_i,q_{goal})$: best path robot cannot see

Continually move robot such that distance to goal is decreased

Note similarity to A* search heuristic

Tangent Bug

$G(x) = d(x,O_i)+d(O_i,q_{goal})$

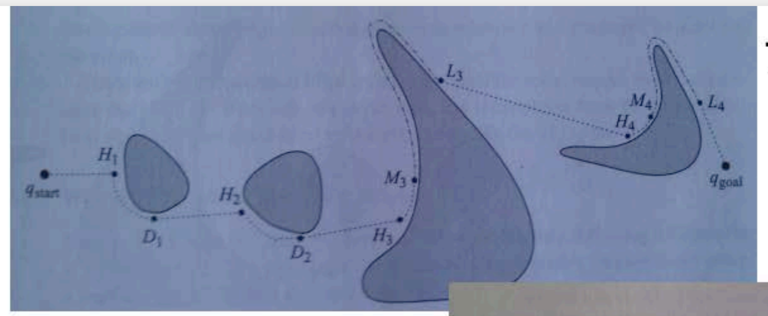


min $G(x)$ in red, others in yellow

1) motion-to-goal: Move to current O_i to minimize $G(x)$, until goal (success) or $G(x)$ increases (local minima)

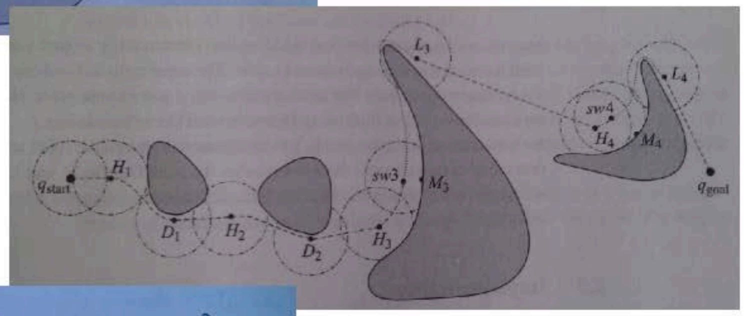
2) boundary-follow: move in while loop:
   a) repeat updates
      d_{reach} = min $d(q_{goal}, \{\text{visible } O_i\})$
      d_{follow} = min $d(q_{goal}, \text{sensed}(WO_i))$
      O_i = argmin$_i$ $d(x,O_i)+d(O_i,q_{goal})$
   b) until
      goal reached, (**success**)
      robot cycles around obstacle, (**fail**)
      $d_{reach} < d_{follow}$,
         (**cleared obstacle or local minima**)

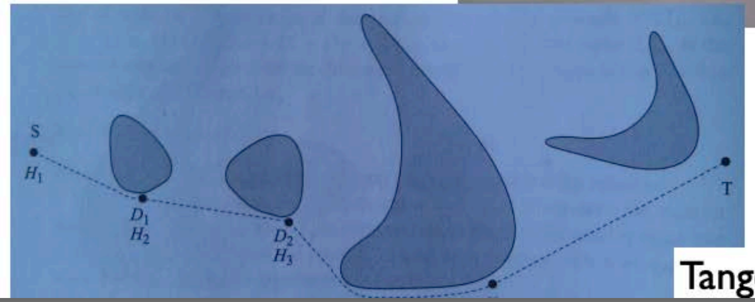
3) continue from (1)



Tangent bug R=0

Tangent bug with limited radius





Tangent bug R=infinity

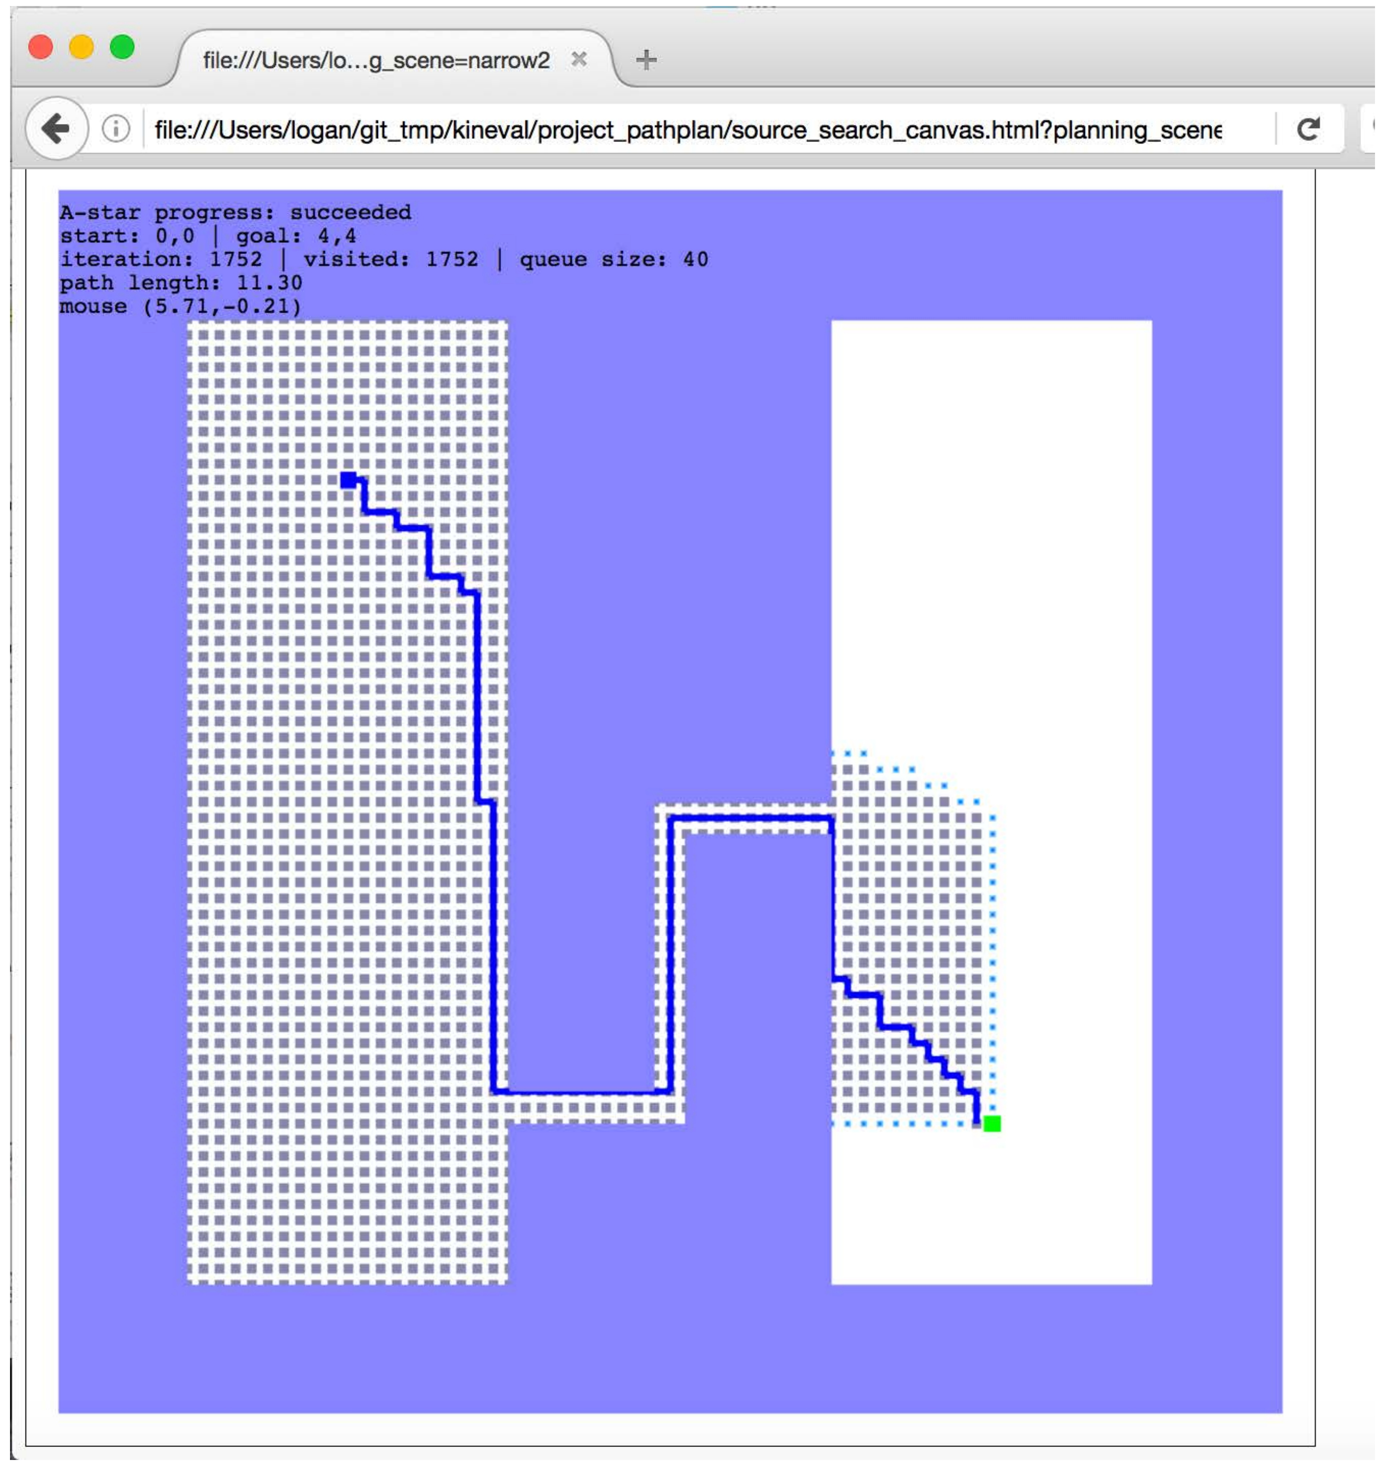
Will our current search methods apply to this robot?

2D Path Planning

N-dimensional Motion Planning



Will our current search methods apply to this robot?

<u>Assumptions:</u>

- Known graph of traversability
    - How big is this graph? How was this graph built?
- Known localization and map/obstacles
    - How do we detect collisions?
    - Is our robot just a point in workspace?
- Known link geometry
    - Does robot geometry change wrt. configuration?

Configuration Spaces

seibertron.net

more than meets the eye

Configuration Space
(or C-space)

- C-space (Q) is the space of all possible configurations (q) of a system
  - kinematics: geometry of possible configurations, without respect to physics
  - dynamics: evolution of configurations over time wrt. physics

- Each degree of freedom (q_i) is a dimension of C-space

- The span of C-space is constrained by obstacles (QO_i), joint limits, etc.

Consider some examples of configuration spaces

Configuration Space

- Consider a robot d=21 DOFs, where each DOF can take 1 of n=10 angular values
- How many configurations?

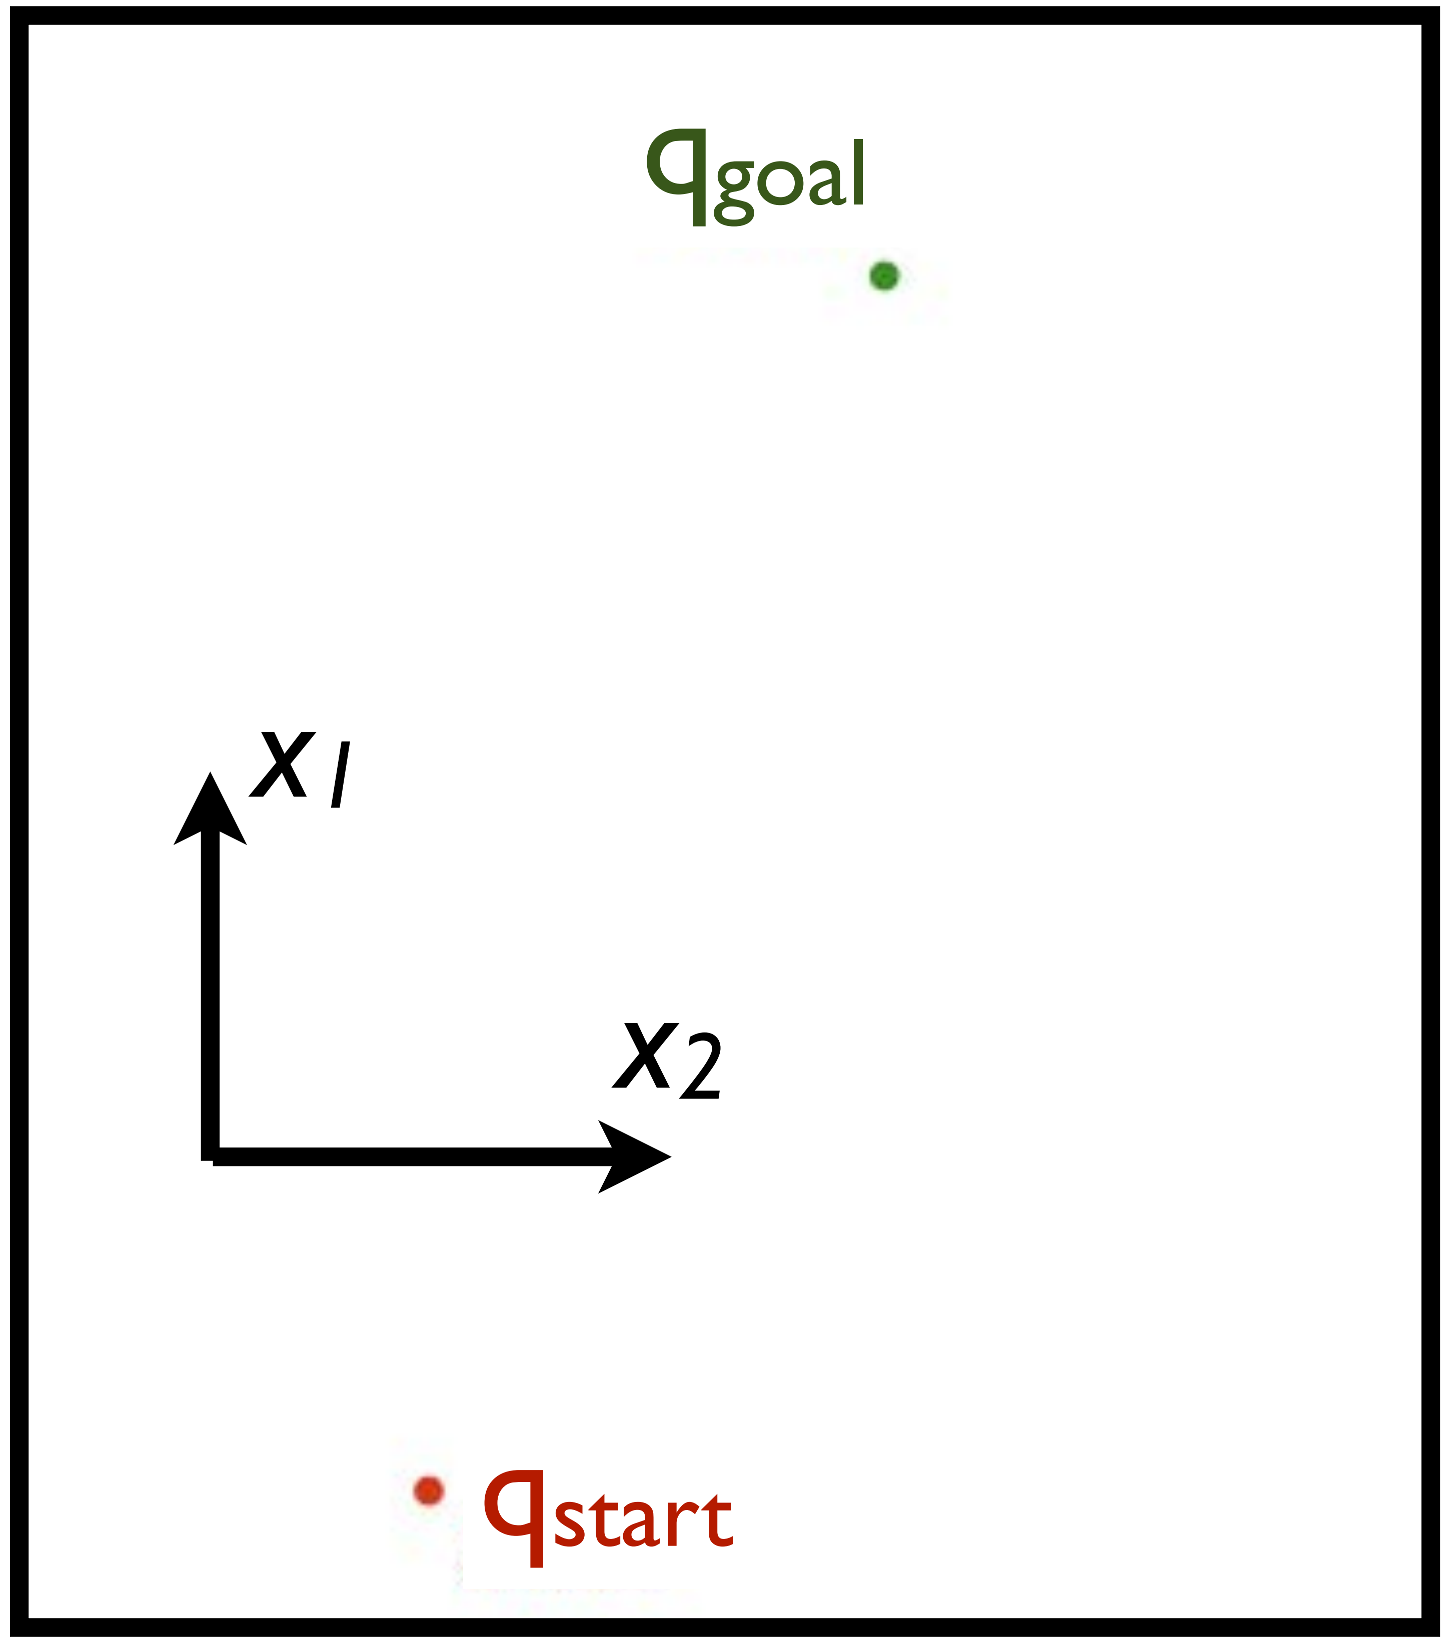
[redacted]

Configuration Space

- Consider a robot d=21 DOFs, where each DOF can take 1 of n=10 angular values
- How many configurations?
  - 10^{21}, n^d in general
- **"Curse of dimensionality"**
  - exponential growth of C-space wrt. number of DOFs
- Obstacles also create discontinuities and nonlinearities in C-space

C-space examples

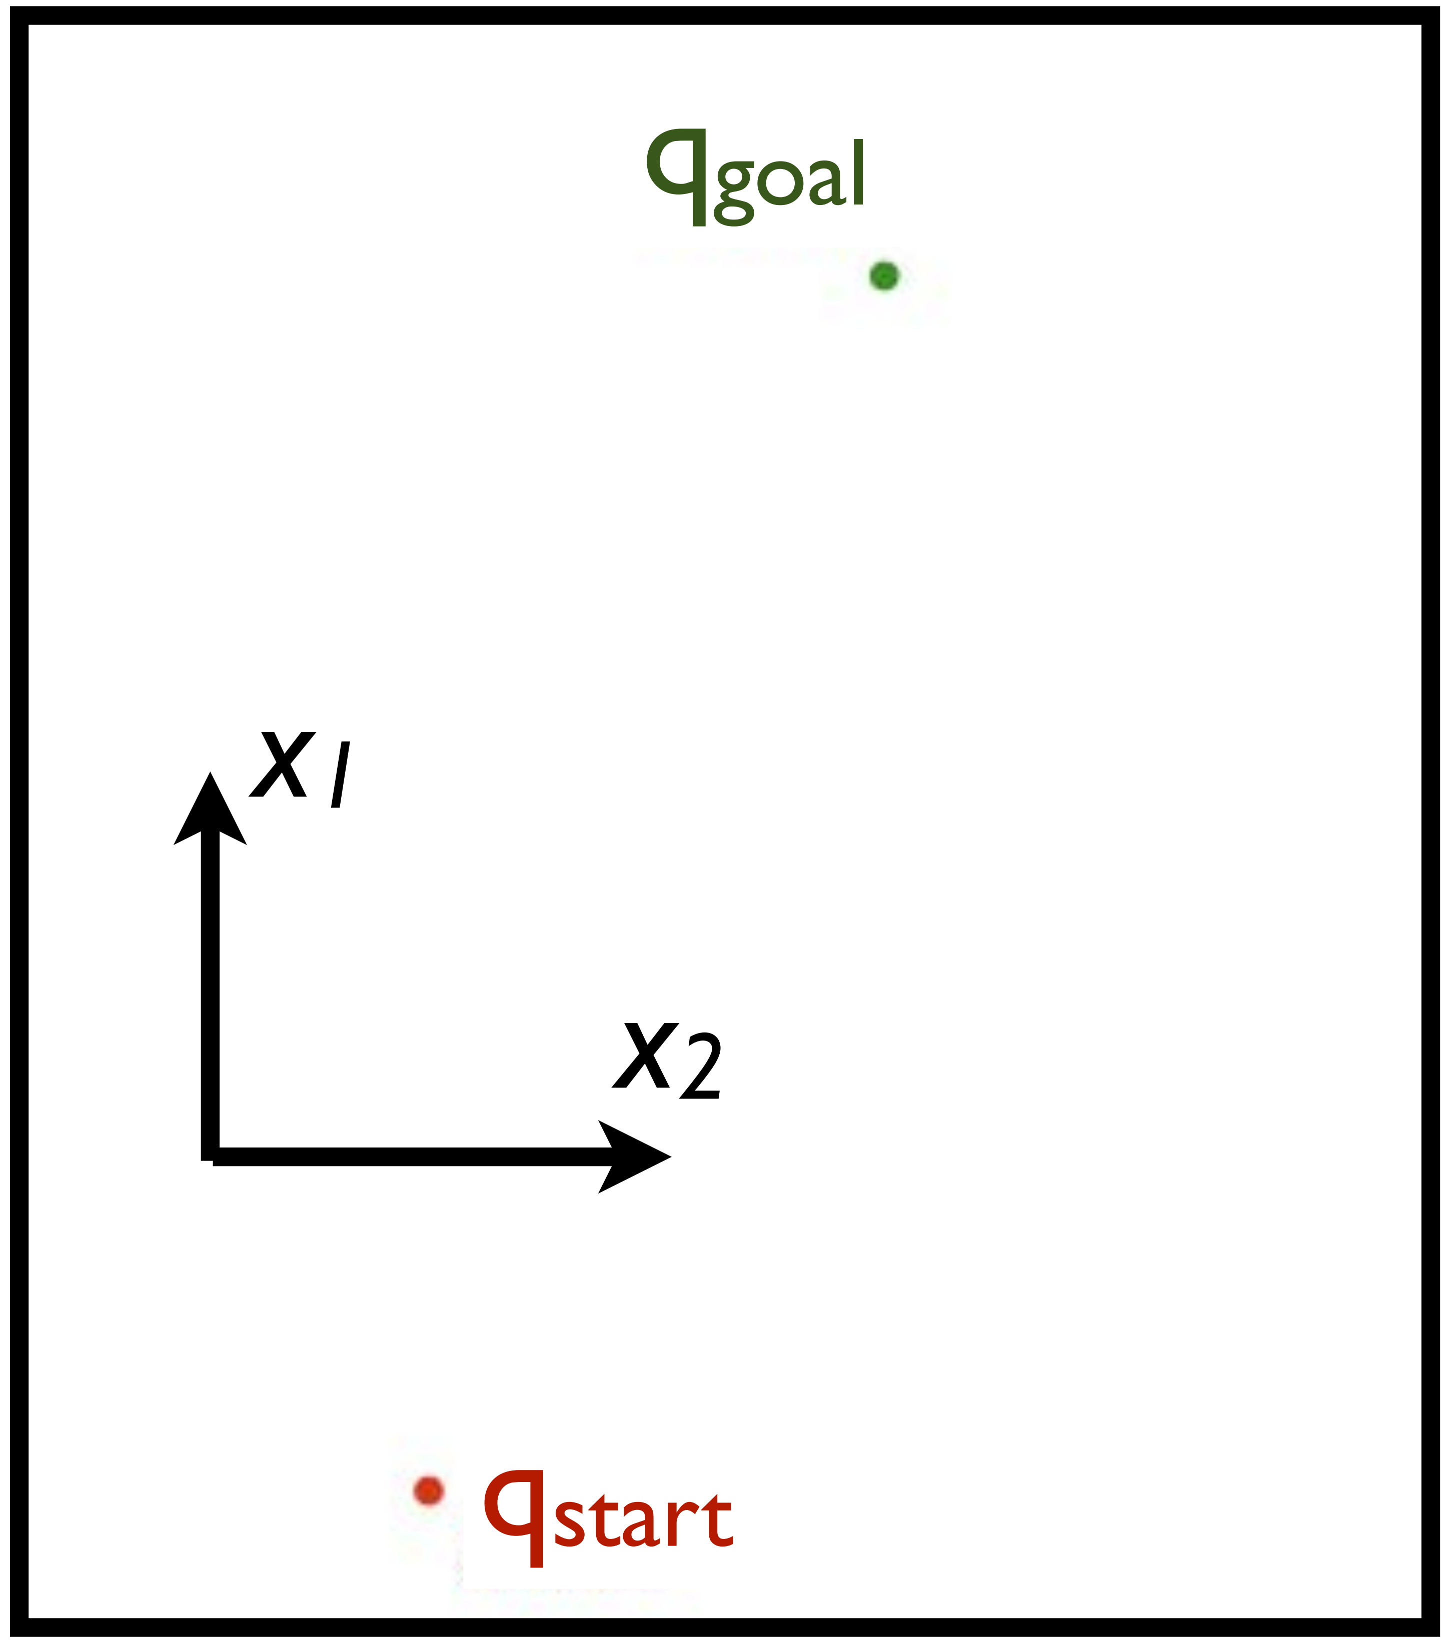
- How many configurations are in the C-space of a planar point robot in a bounded rectangular world?



C-space examples

- How many configurations are in the C-space of a planar point robot in a bounded rectangular world?
  - DOFs: 2, $\{x_1, x_2\}$
  - Number of poses is infinite
  - C-space: $\Re^2$

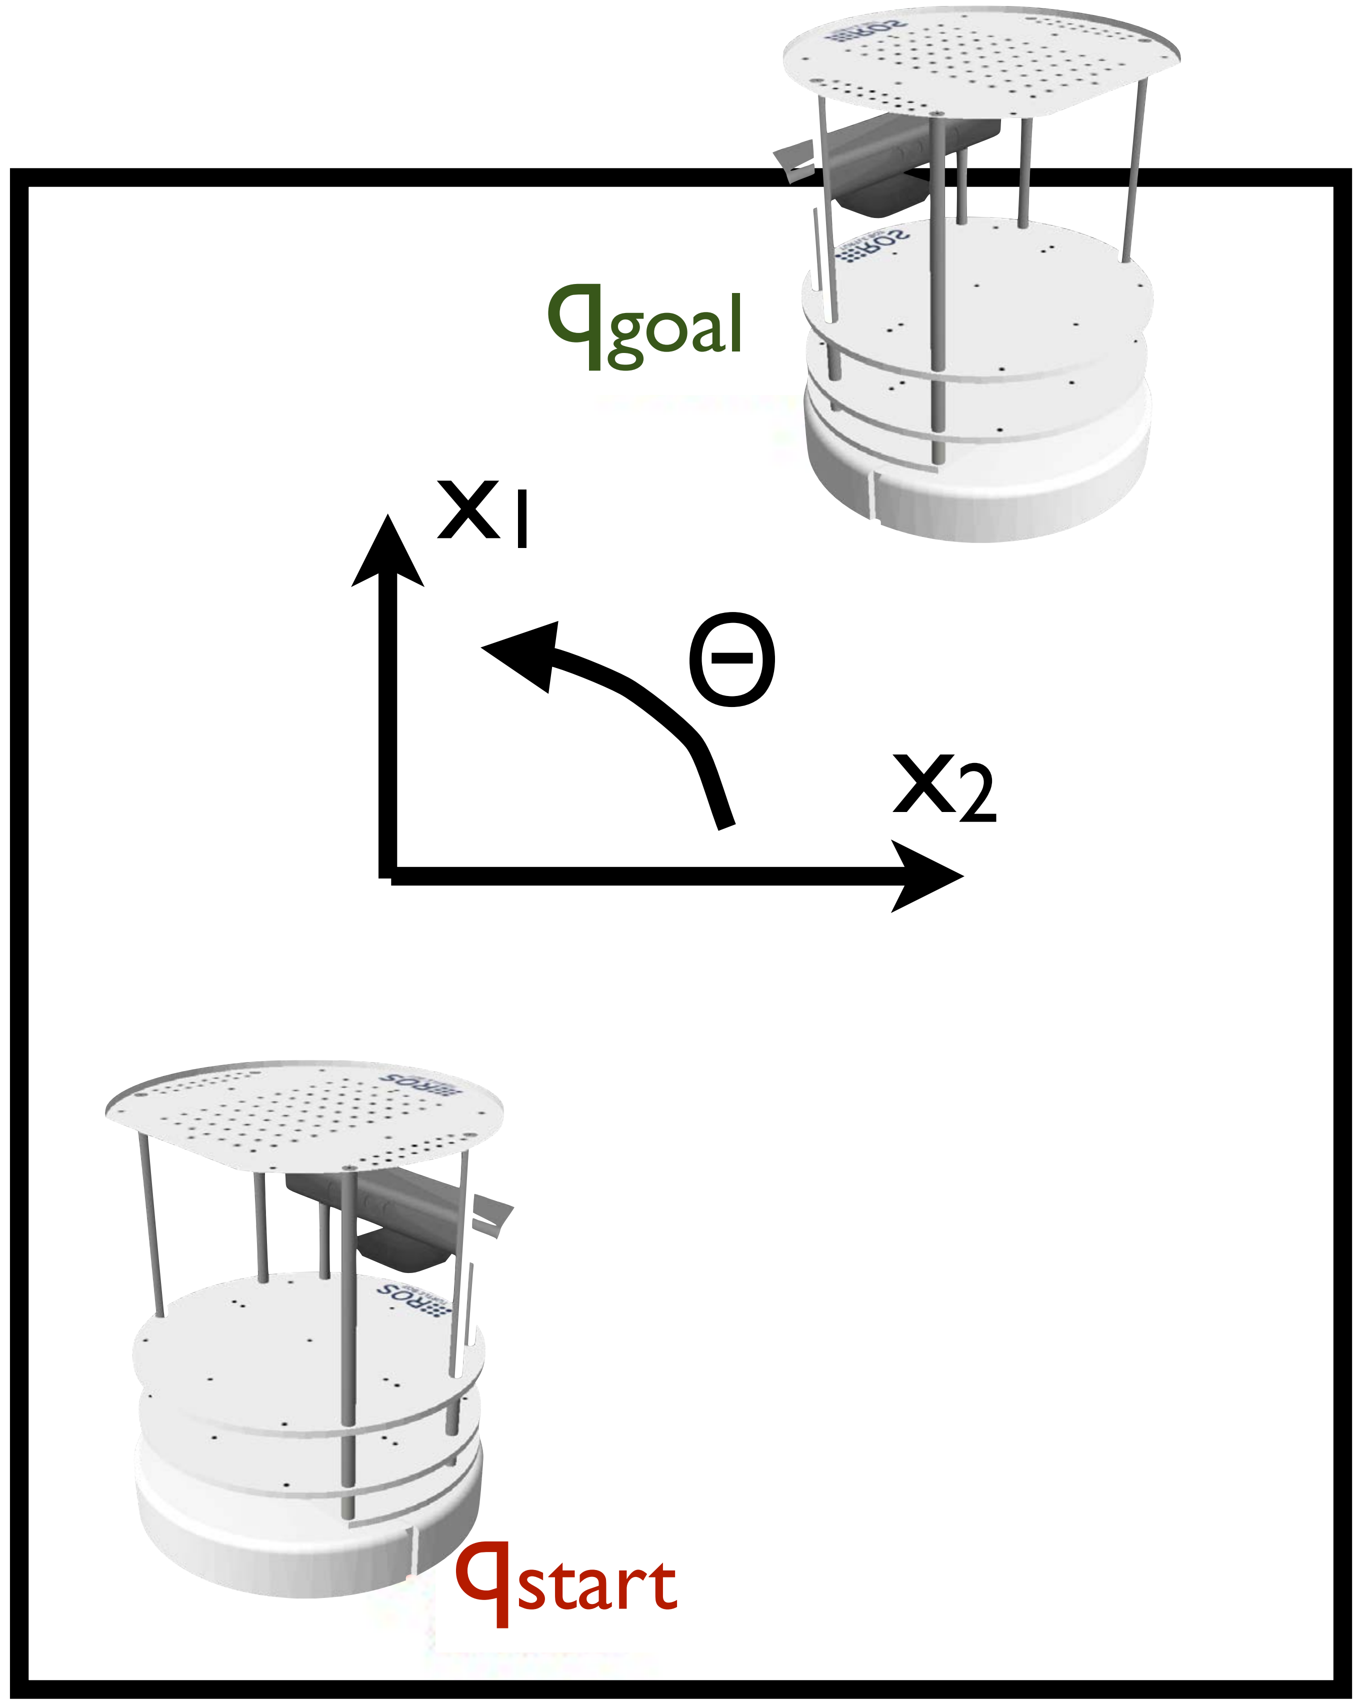
Toplogically, this C-space is a homeomorphism of $\Re^2$



C-space examples

- What is the C-space of a Turtlebot?

[redacted]



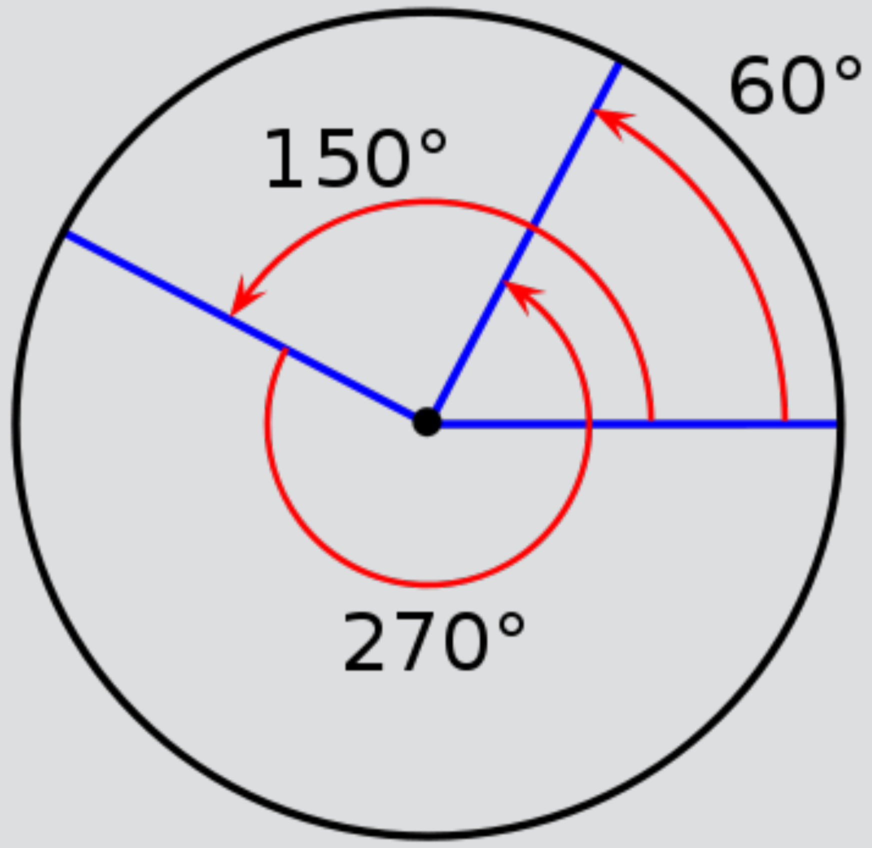
C-space examples

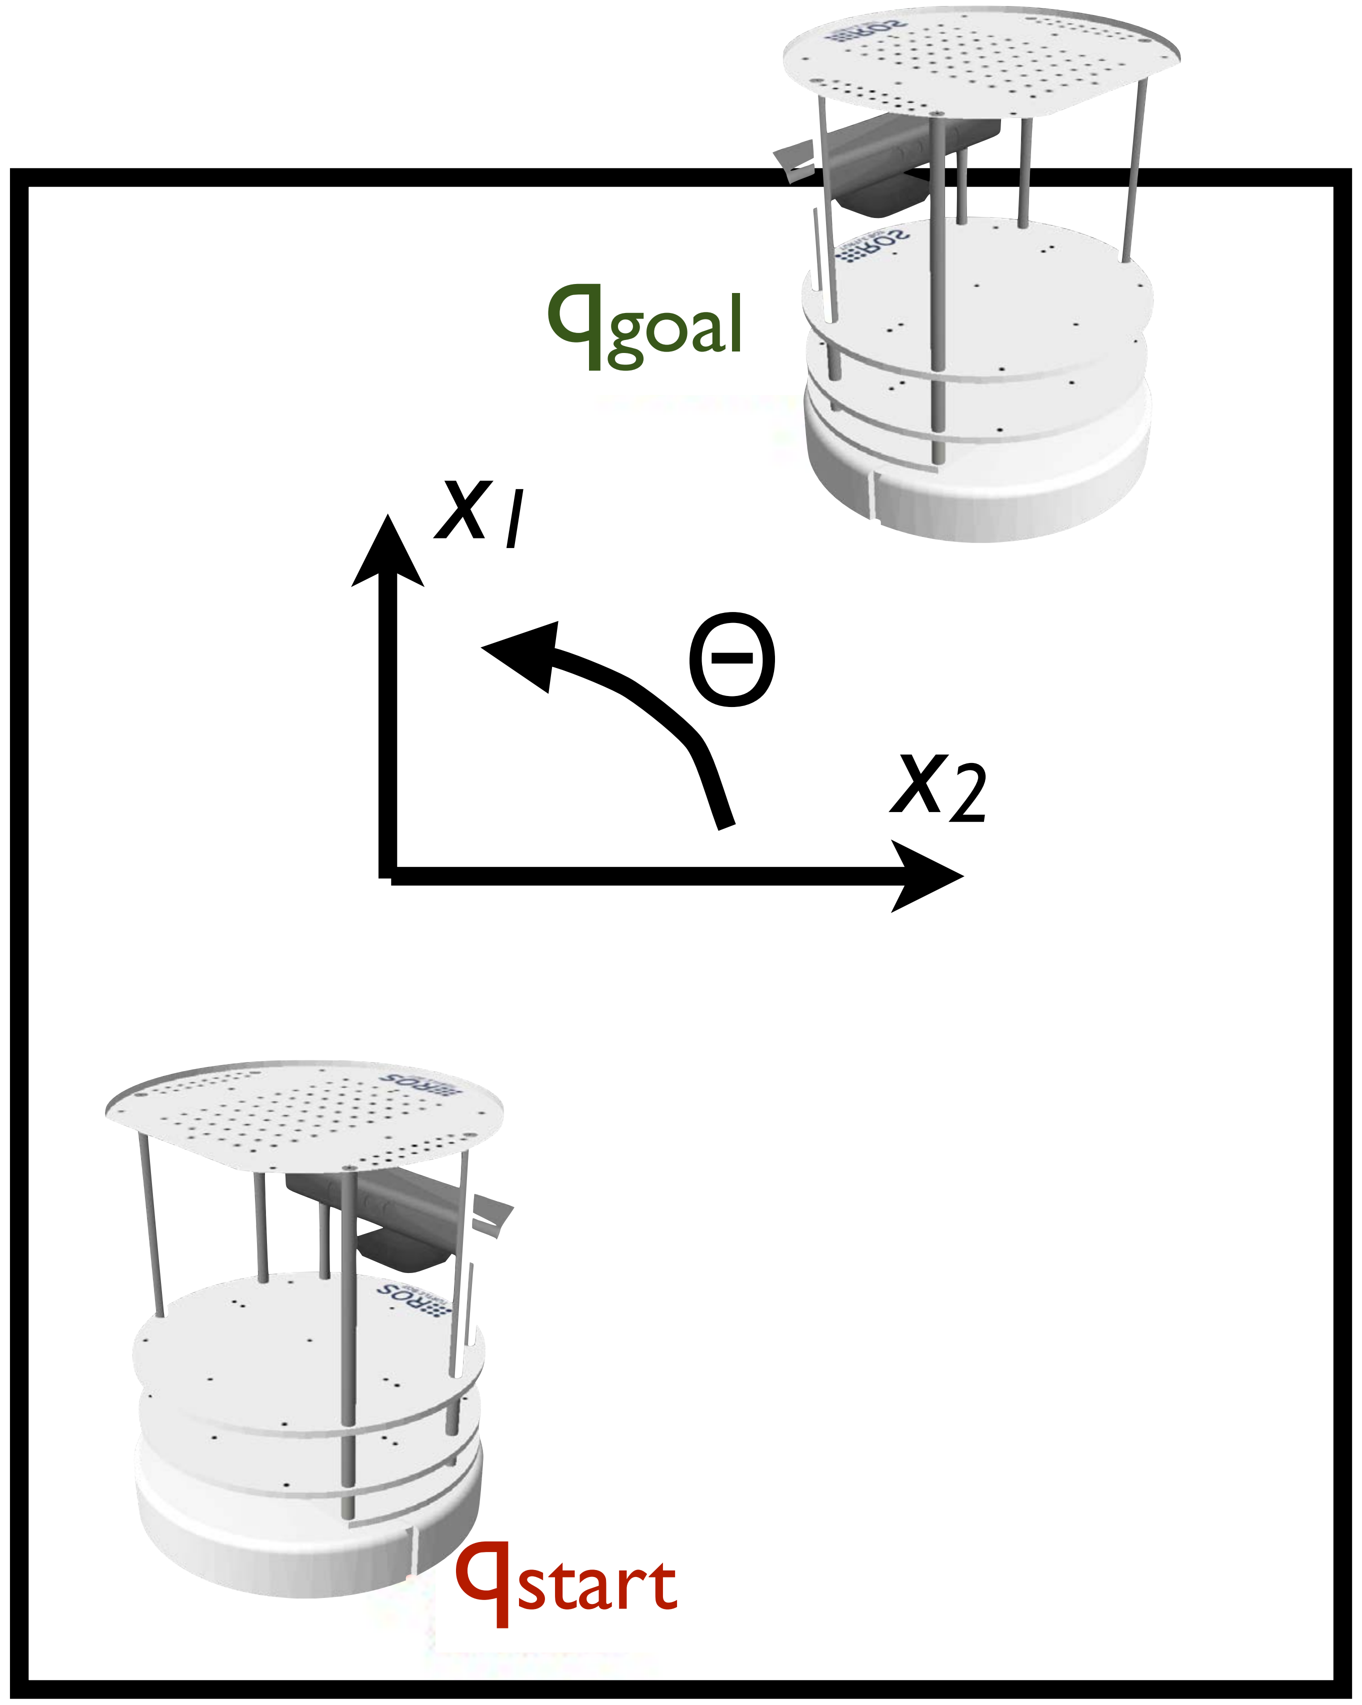
- What is the C-space of a Turtlebot?
  - DOFs: 3, $\{x_1, x_2, \Theta\}$
  - C-space: $\Re^2 \times S^1$

S^1 is the 1-sphere
group of 1D rotations

S^n is the n-sphere

$S^1 \times S^1 \neq S^n$





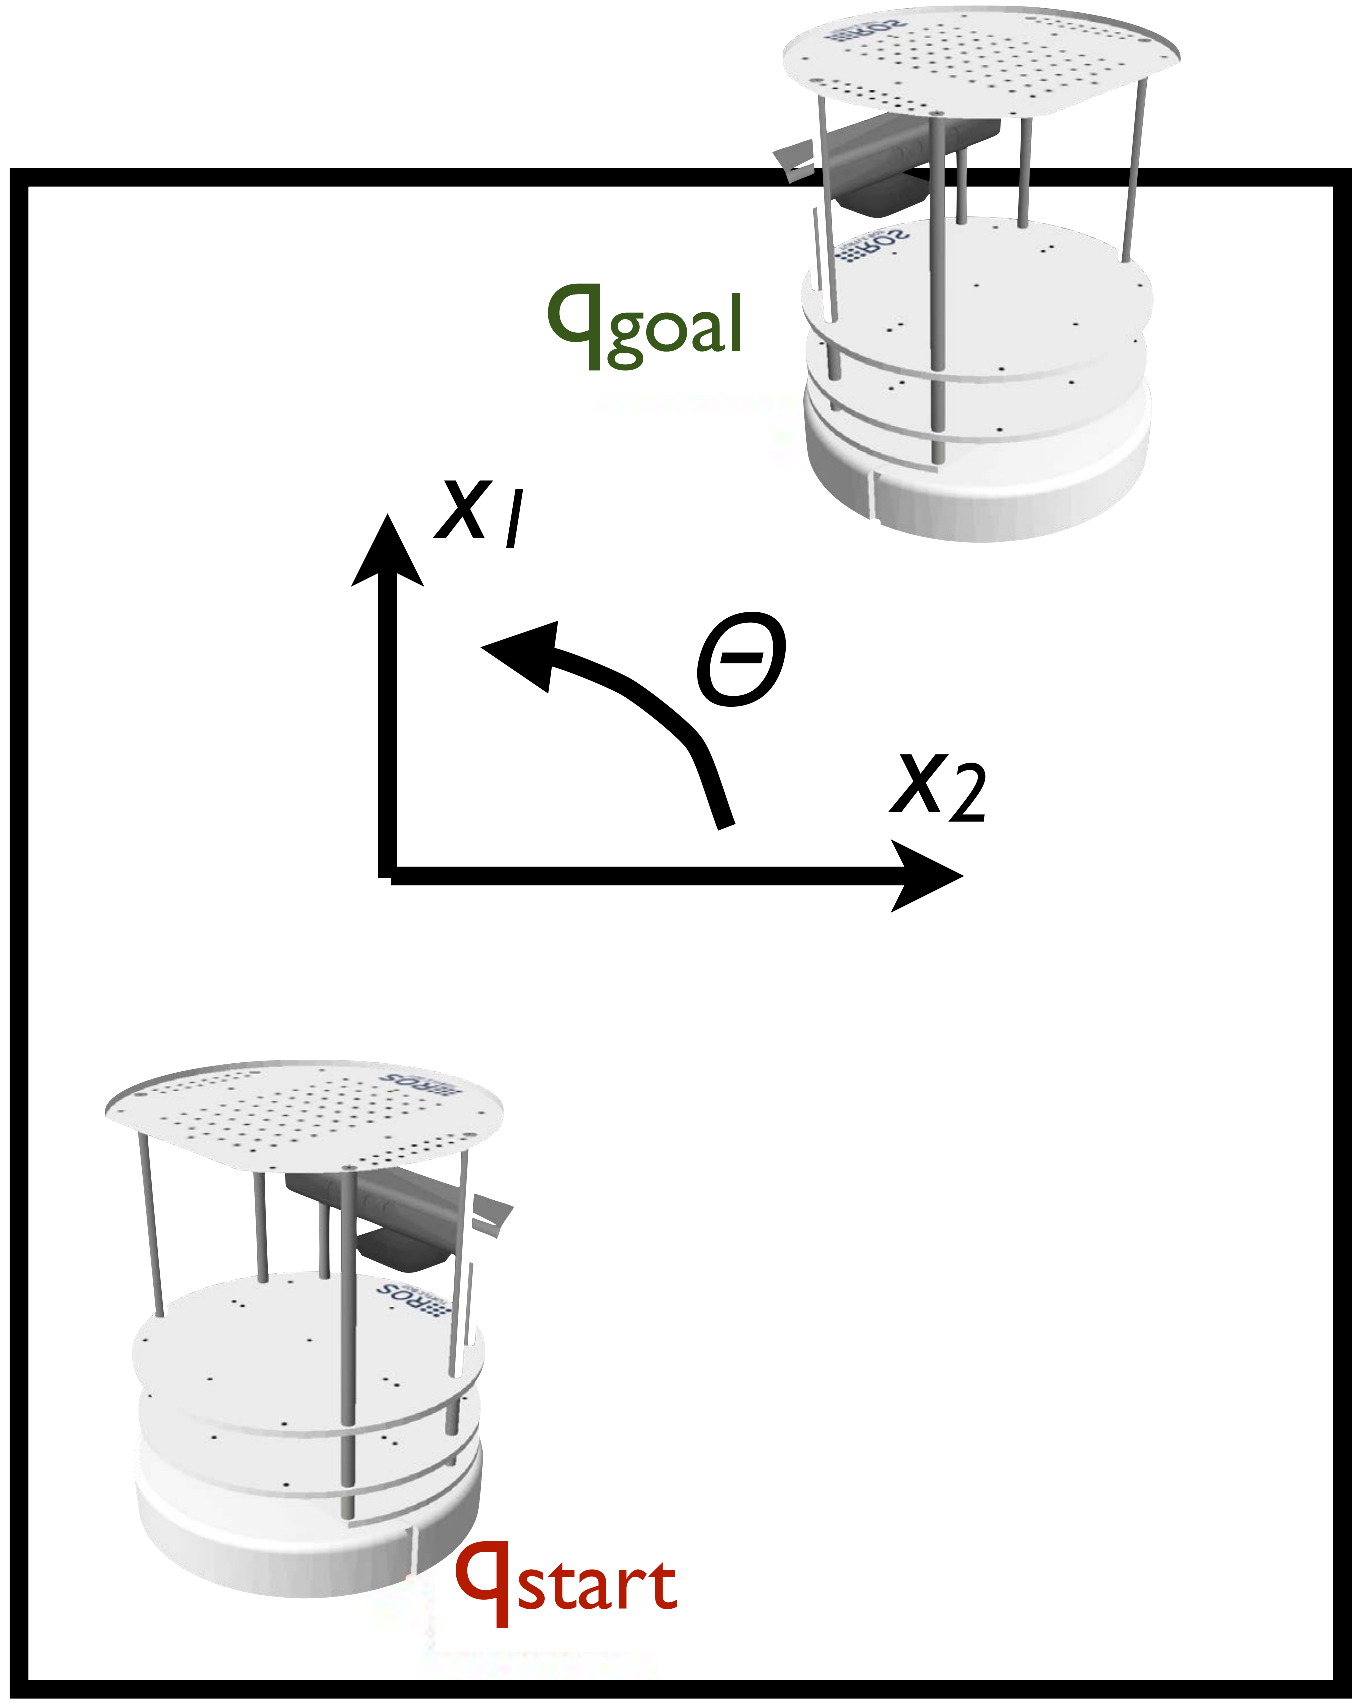
C-space examples

- What is the C-space of a Turtlebot?
  - DOFs: 3, $\{x_1, x_2, \Theta\}$
  - C-space: $\Re^2 \times S^1$

2D translation   rotation in 2D

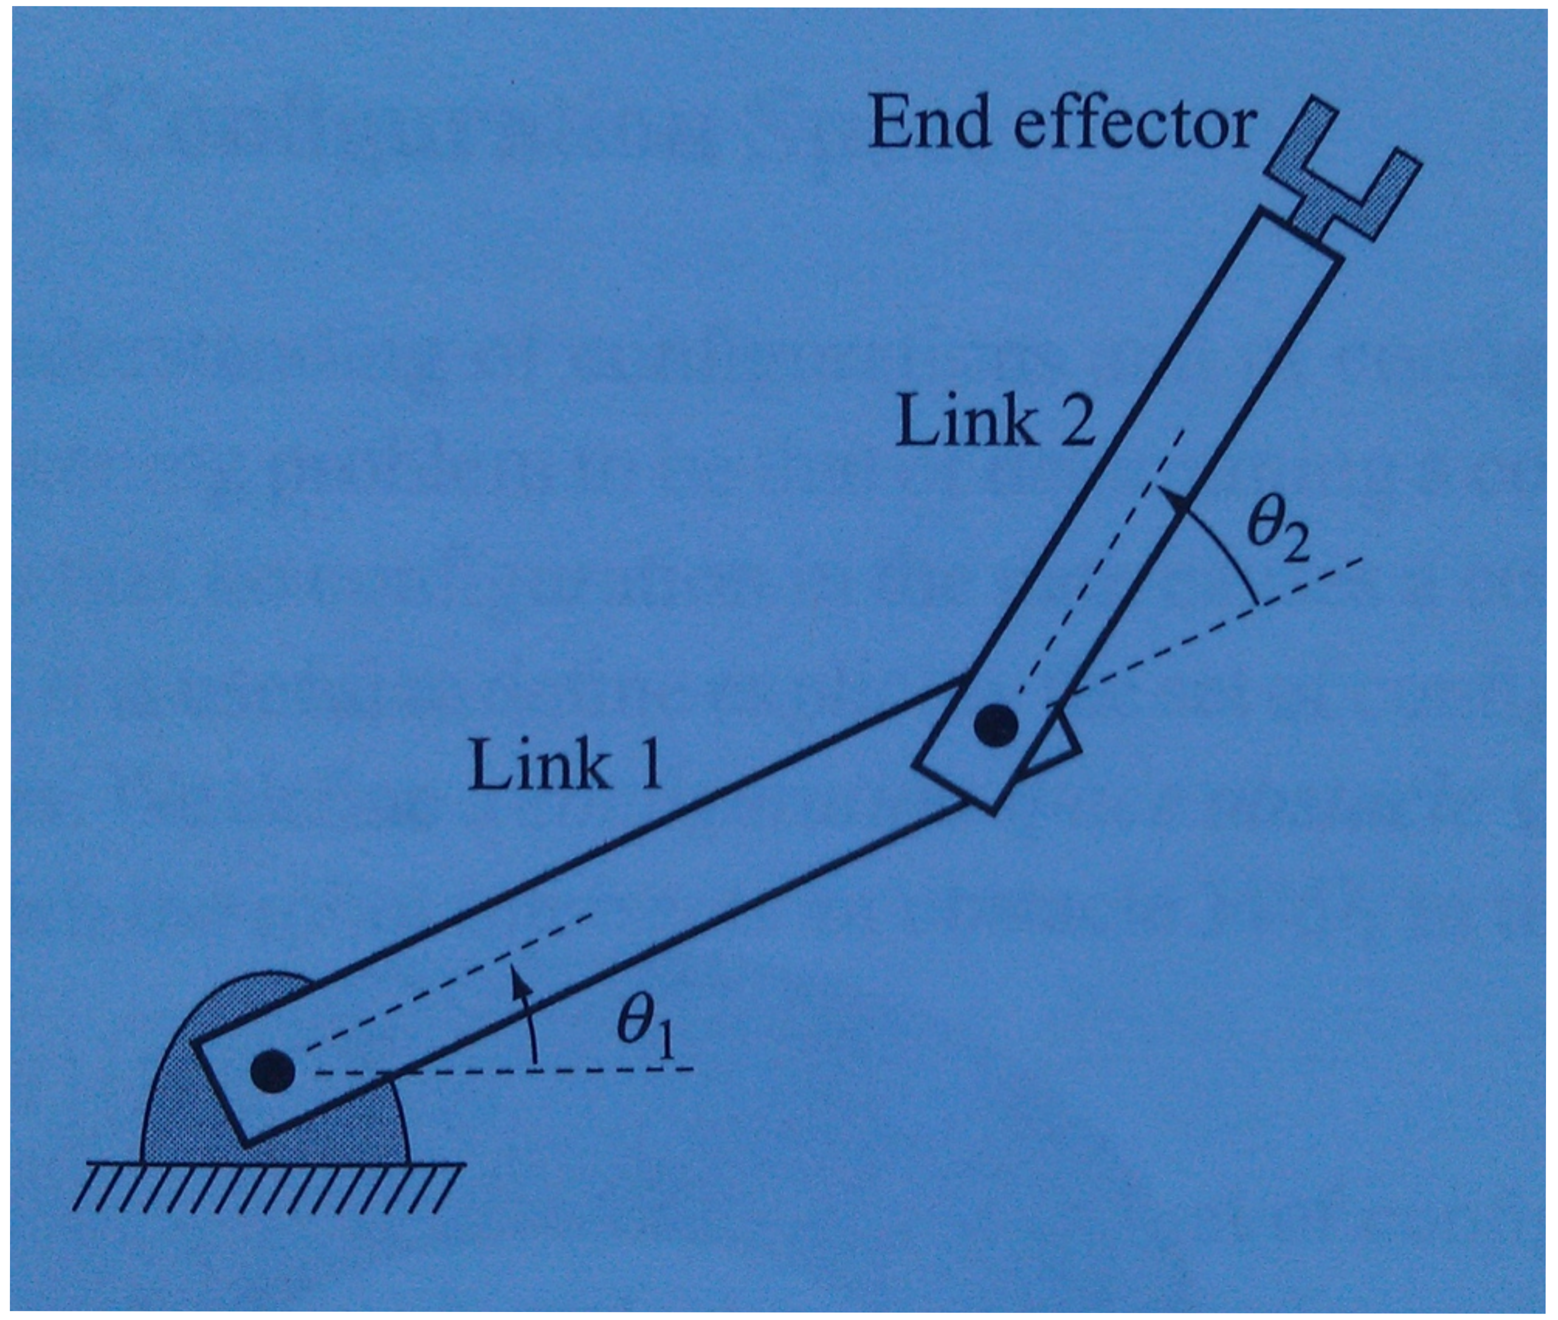
$\Re^2 \times S^1$ is also known as the $SE(2)$ group.

Group of homogeneous transformations in 2D



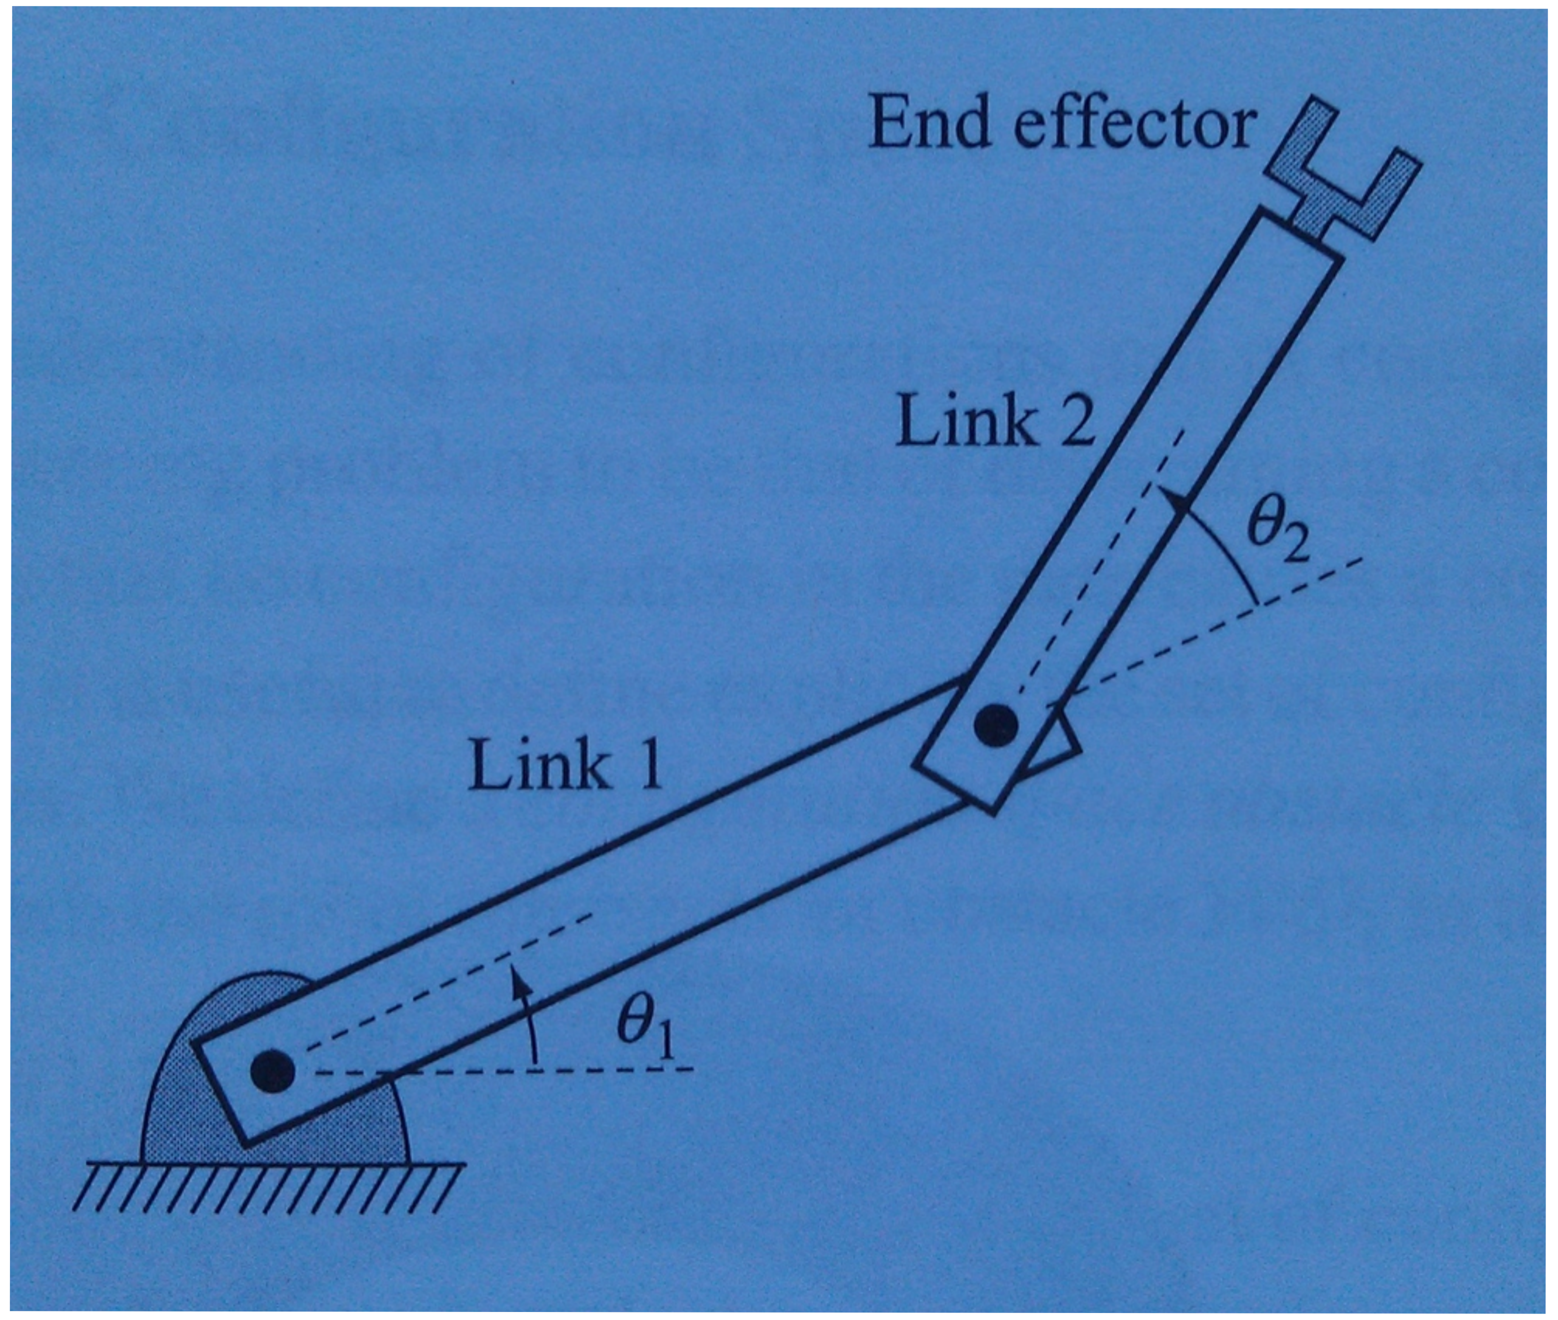
C-space examples

- What is the C-space of a planar arm with 2 rotational joints?



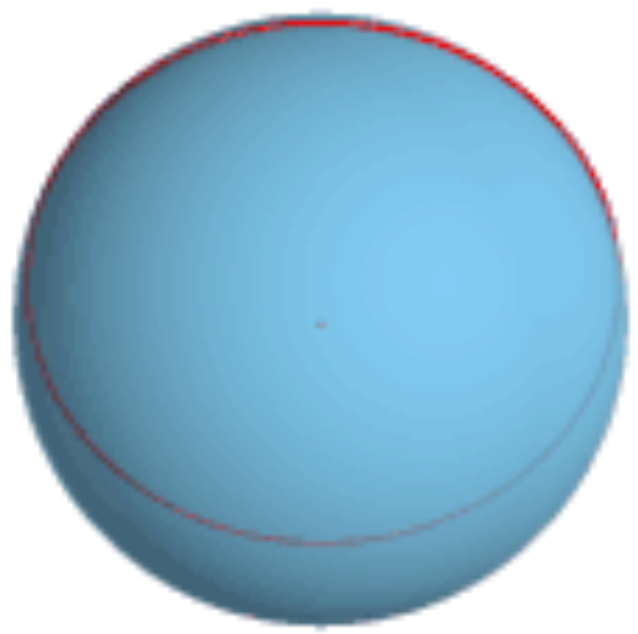
C-space examples

- What is the C-space of a planar arm with 2 rotational joints?
  - DOFs: [redacted]
  - C-space: [redacted]

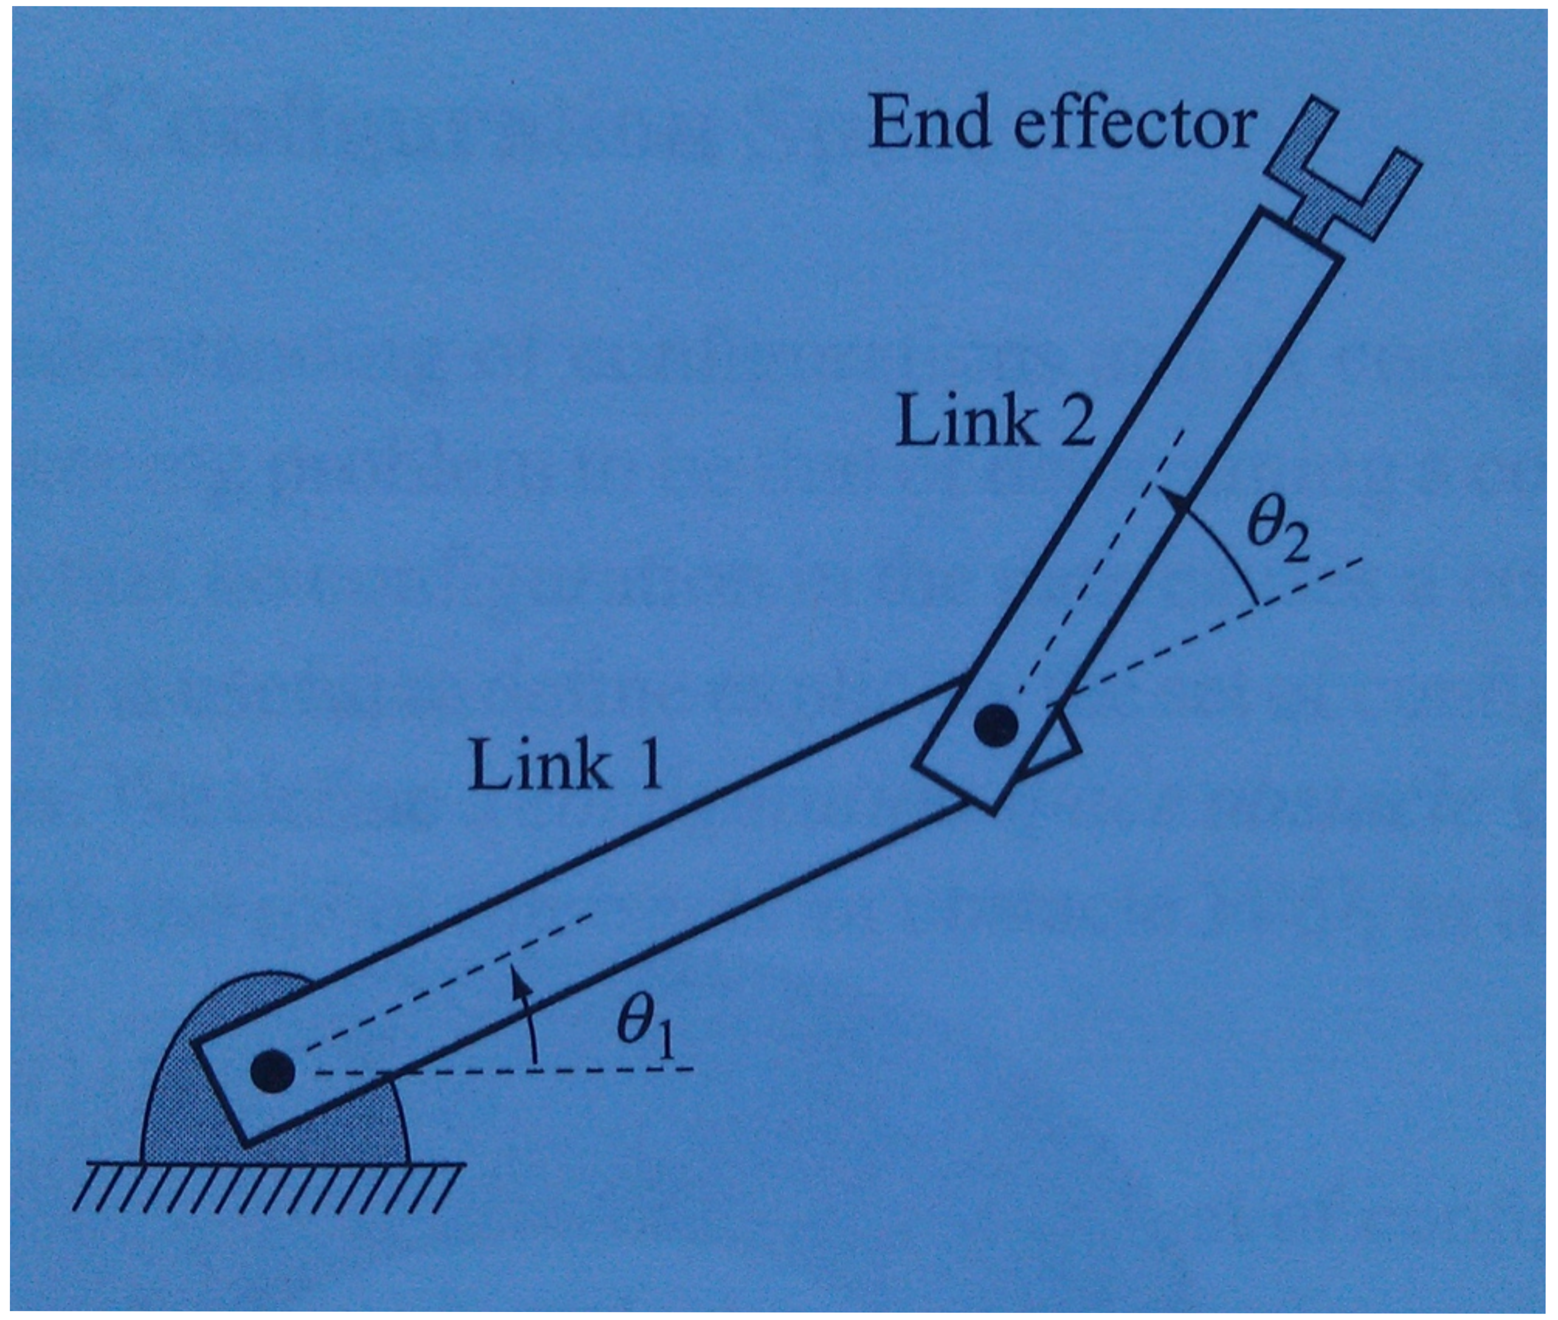


C-space examples

- What is the C-space of a planar arm with 2 rotational joints?
  - DOFs: 2, $\{\Theta_1, \Theta_2\}$
  - C-space: $\Re^2$ or S^2 or $S^1 \times S^1$?

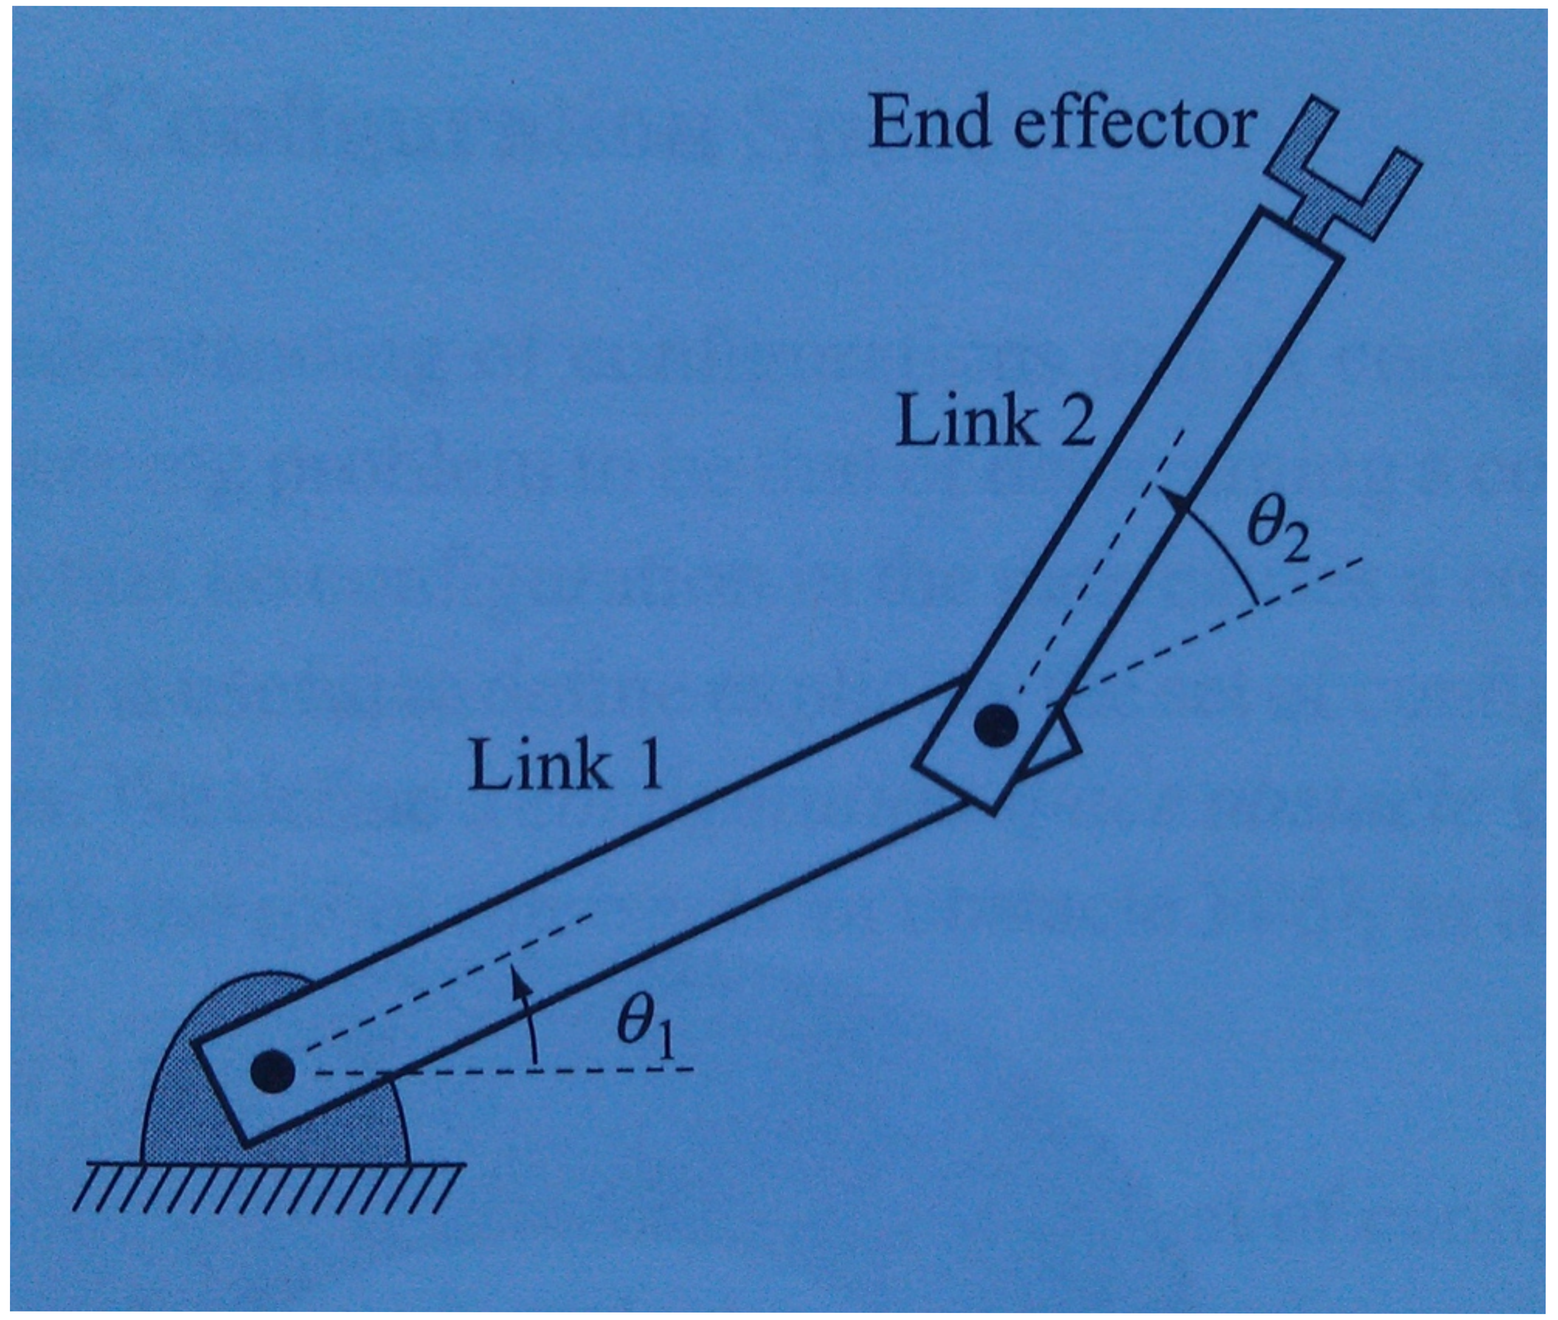


$S^1 \times S^1 = S^2$ when torus axis on surface

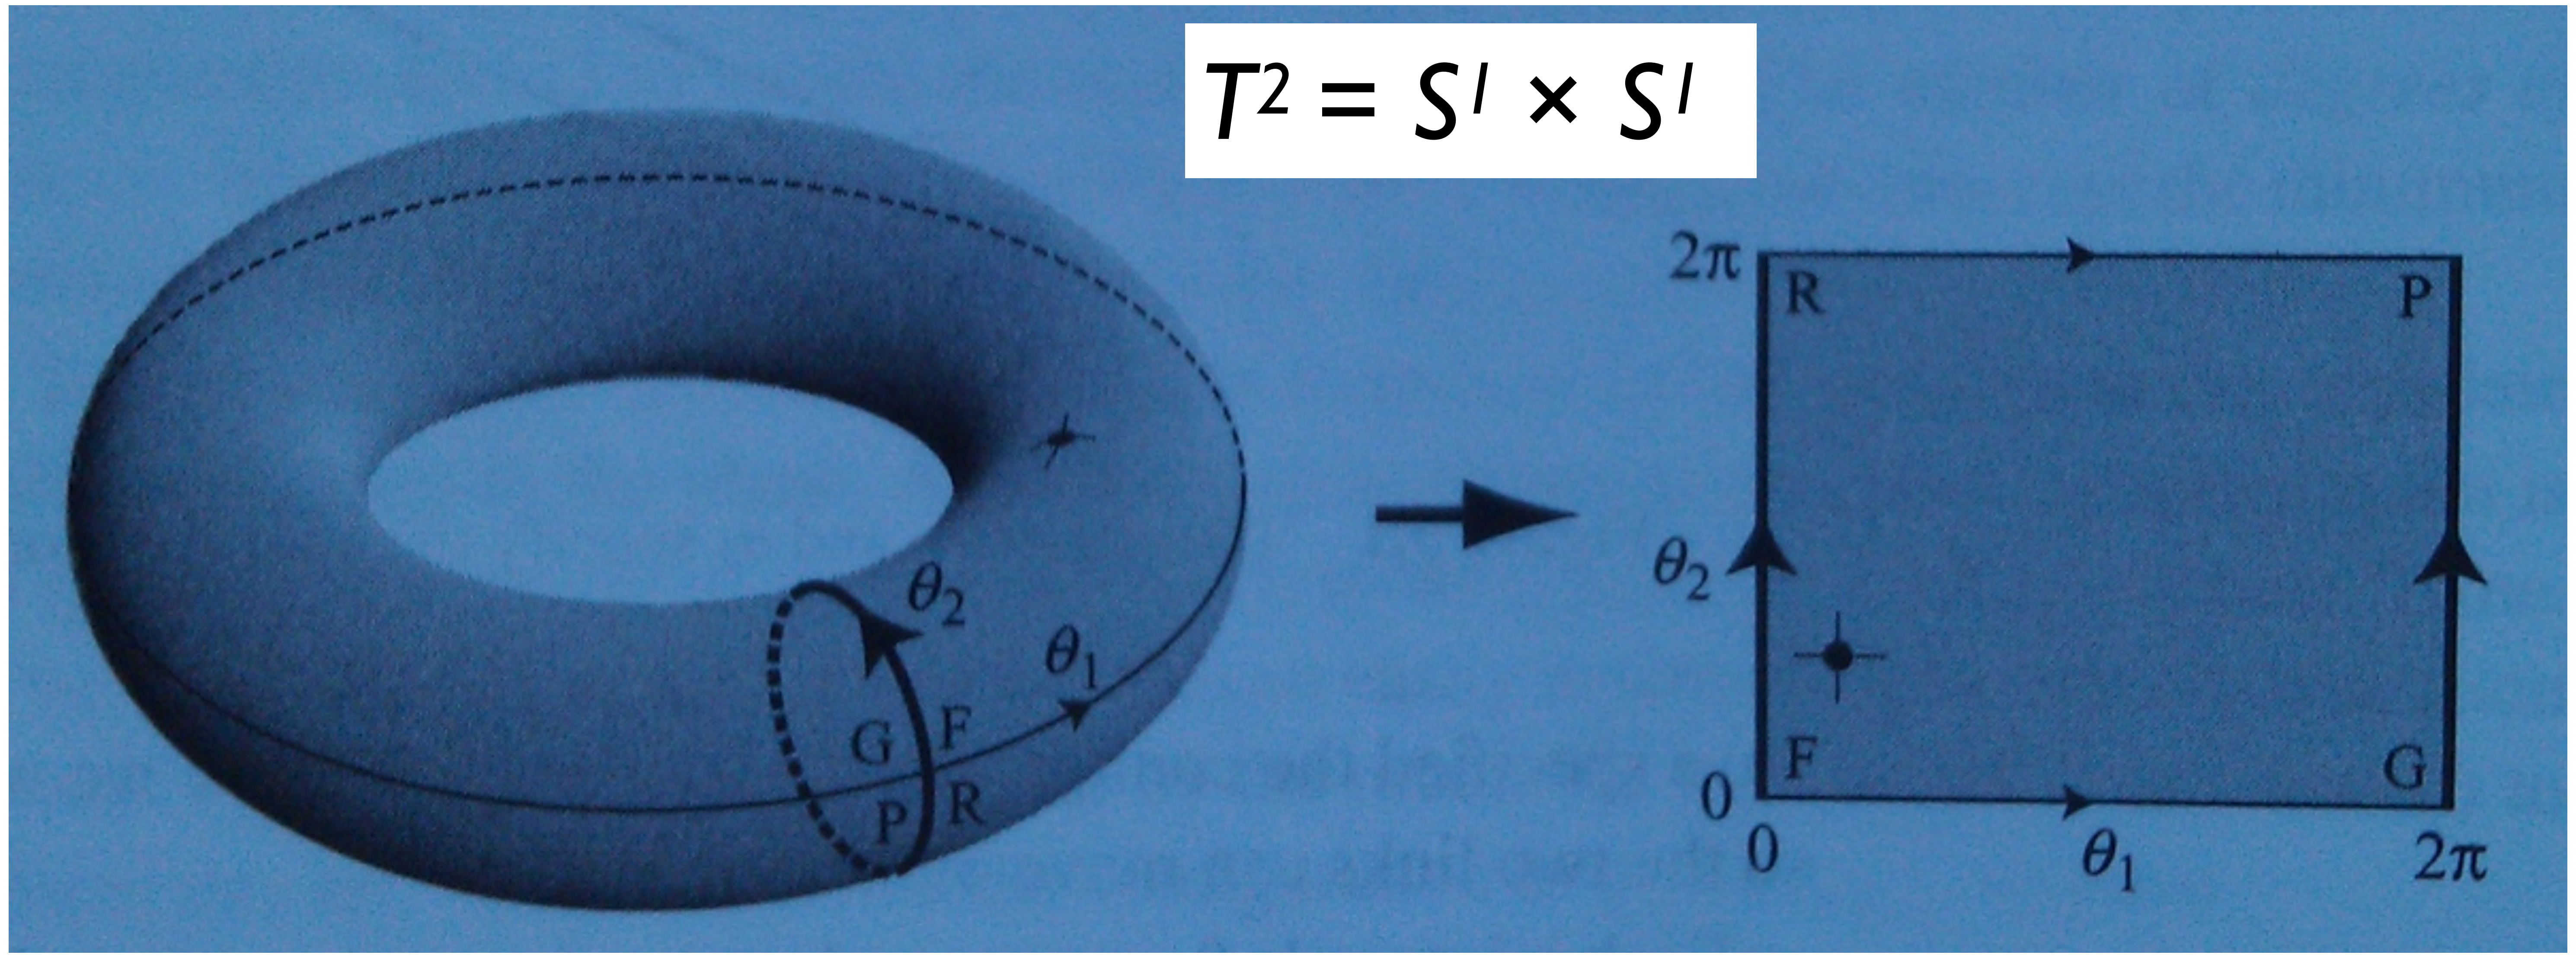


Slide borrowed from Michigan Robotics autorob.org

T^2 Torus Group



Space must fuse on each DOF where 2π = 0



T^n is the torus group for an N-D rotational system

$$\mathbb{T}^n = \underbrace{S^1 \times S^1 \times \cdots \times S^1}_{n}$$

Slide borrowed from Michigan Robotics autorob.org

C-space examples

- What is the C-space of a Barrett WAM arm with 4 rotational joints, not including fingers of gripper?

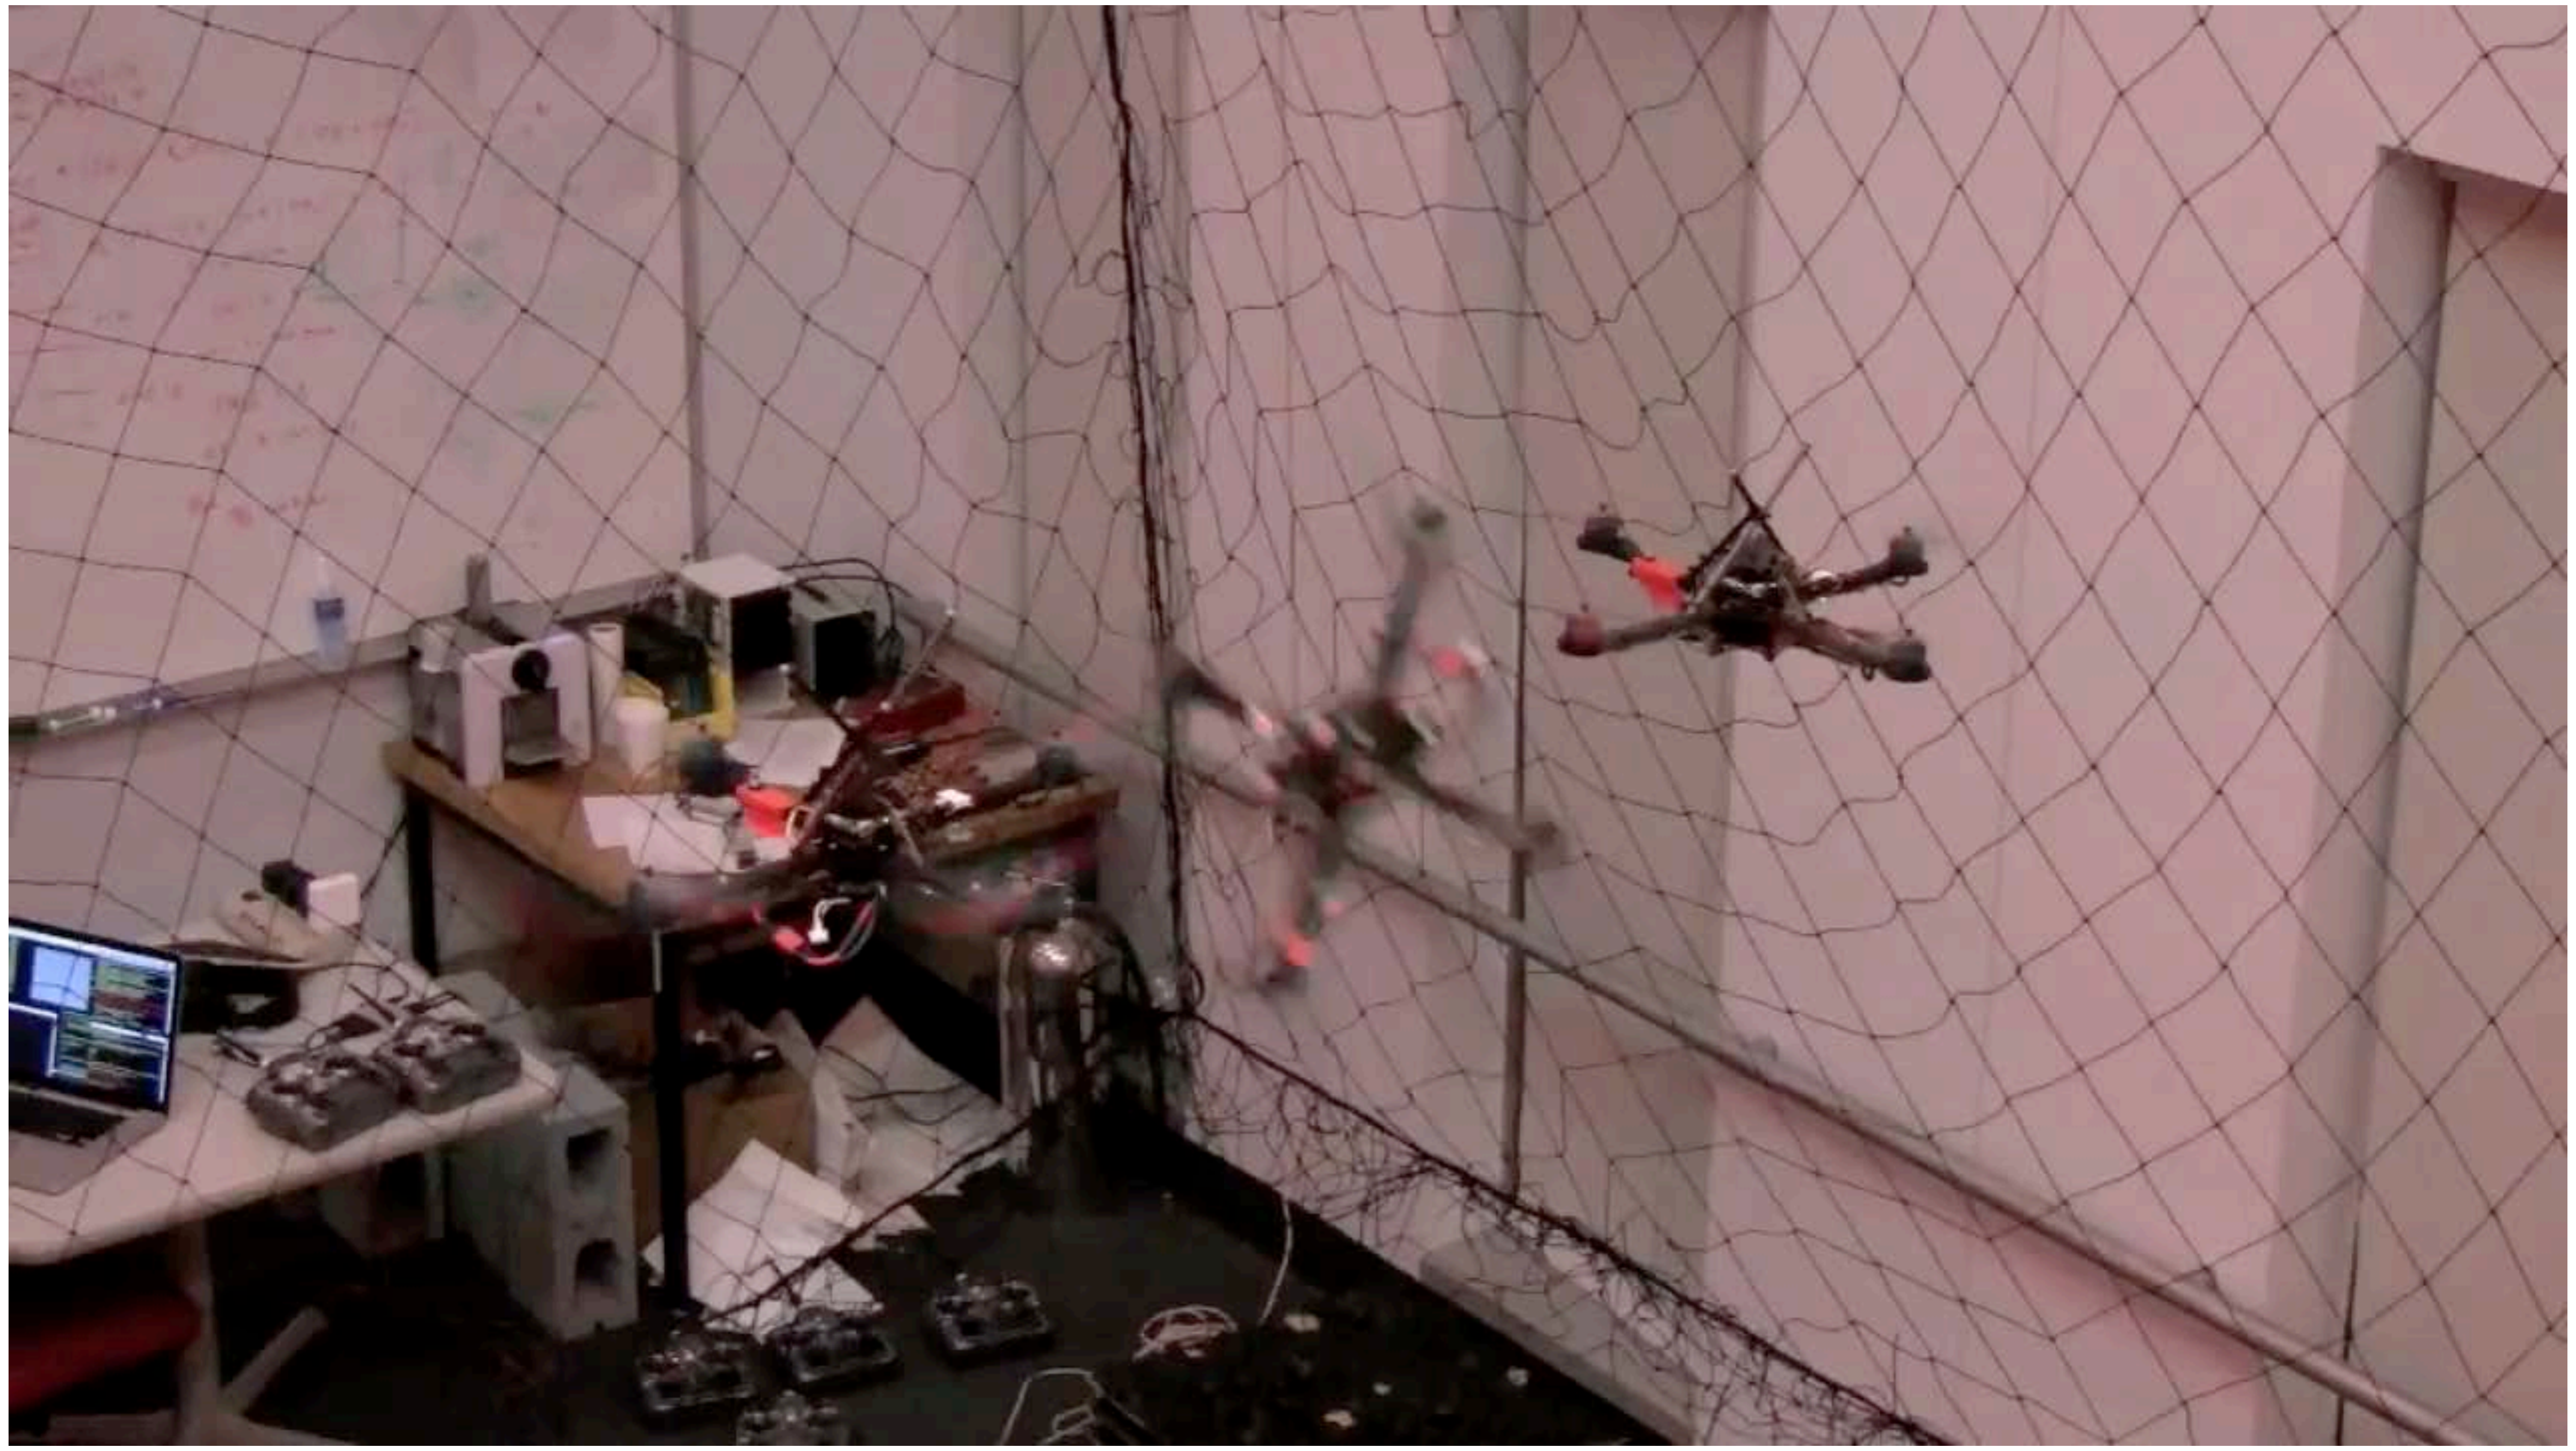
[redacted]

C-space examples

- What is the C-space of a Barrett WAM arm with 4 rotational joints, not including fingers of gripper?
  - DOFs: 4
  - C-space: T^4

C-space examples

- What is the C-space of a quad rotor helicopter?



V. Kumar et al. (2010) - UPenn - https://www.youtube.com/watch?v=MvRTALJp8DM

Drone Racing League (2017) https://www.youtube.com/watch?v=NpgGQCv642o

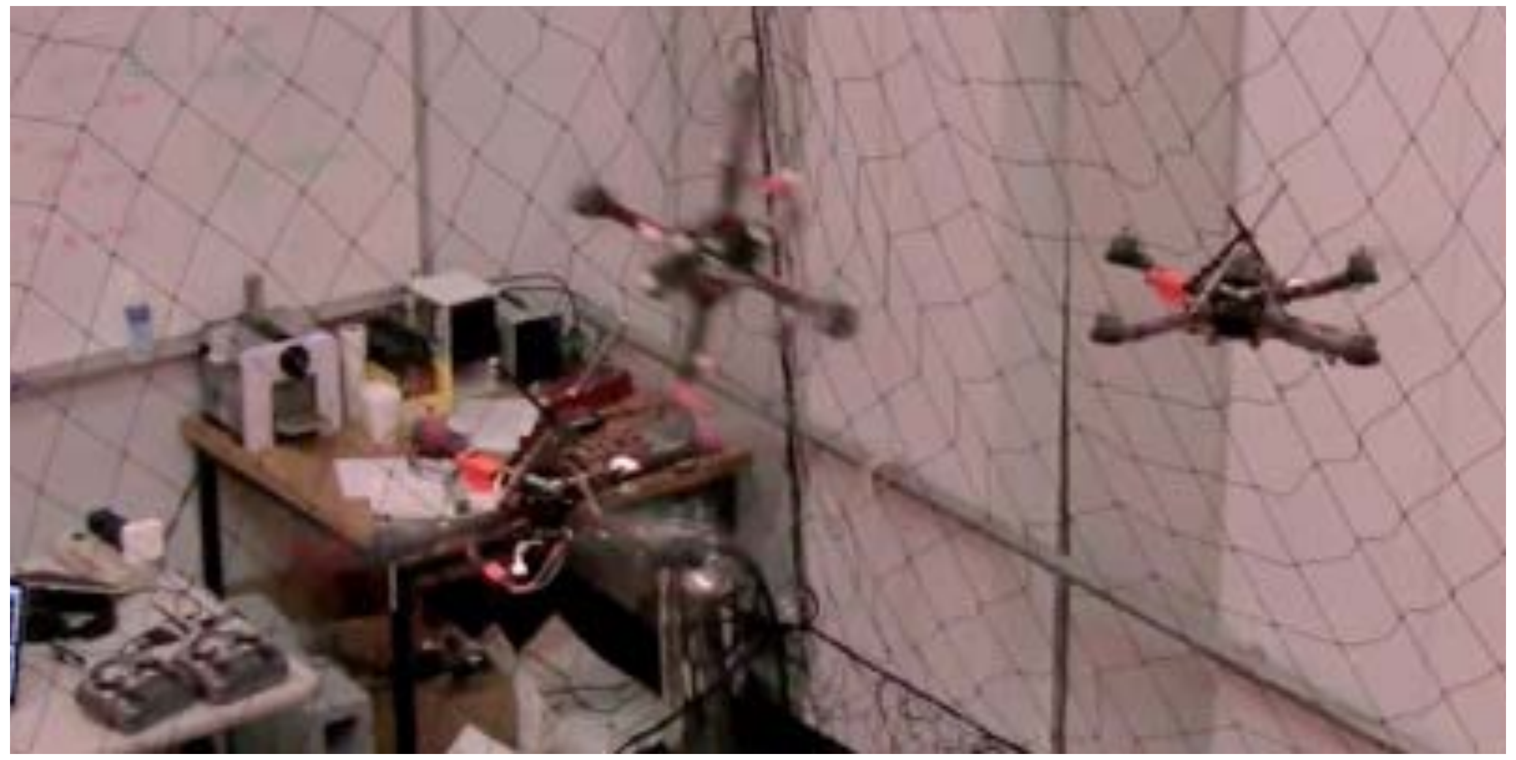
Slide borrowed from Michigan Robotics autorob.org

IROS 2017 Autonomous Drone Racing Competition

https://www.youtube.com/watch?v=y1DvYkPCnmM

C-space examples

- What is the C-space of a quad rotor helicopter?
- DOFs: 6
- C-space: *SE(3)*,
  - or $\Re^3 \times SO(3)$



V. Kumar et al. - UPenn

Group of homogeneous transformations in 3D

3D translation

3D rotation

SE(3) combines:
$\Re^3$: 3D translation and
SO(3): 3D rotation

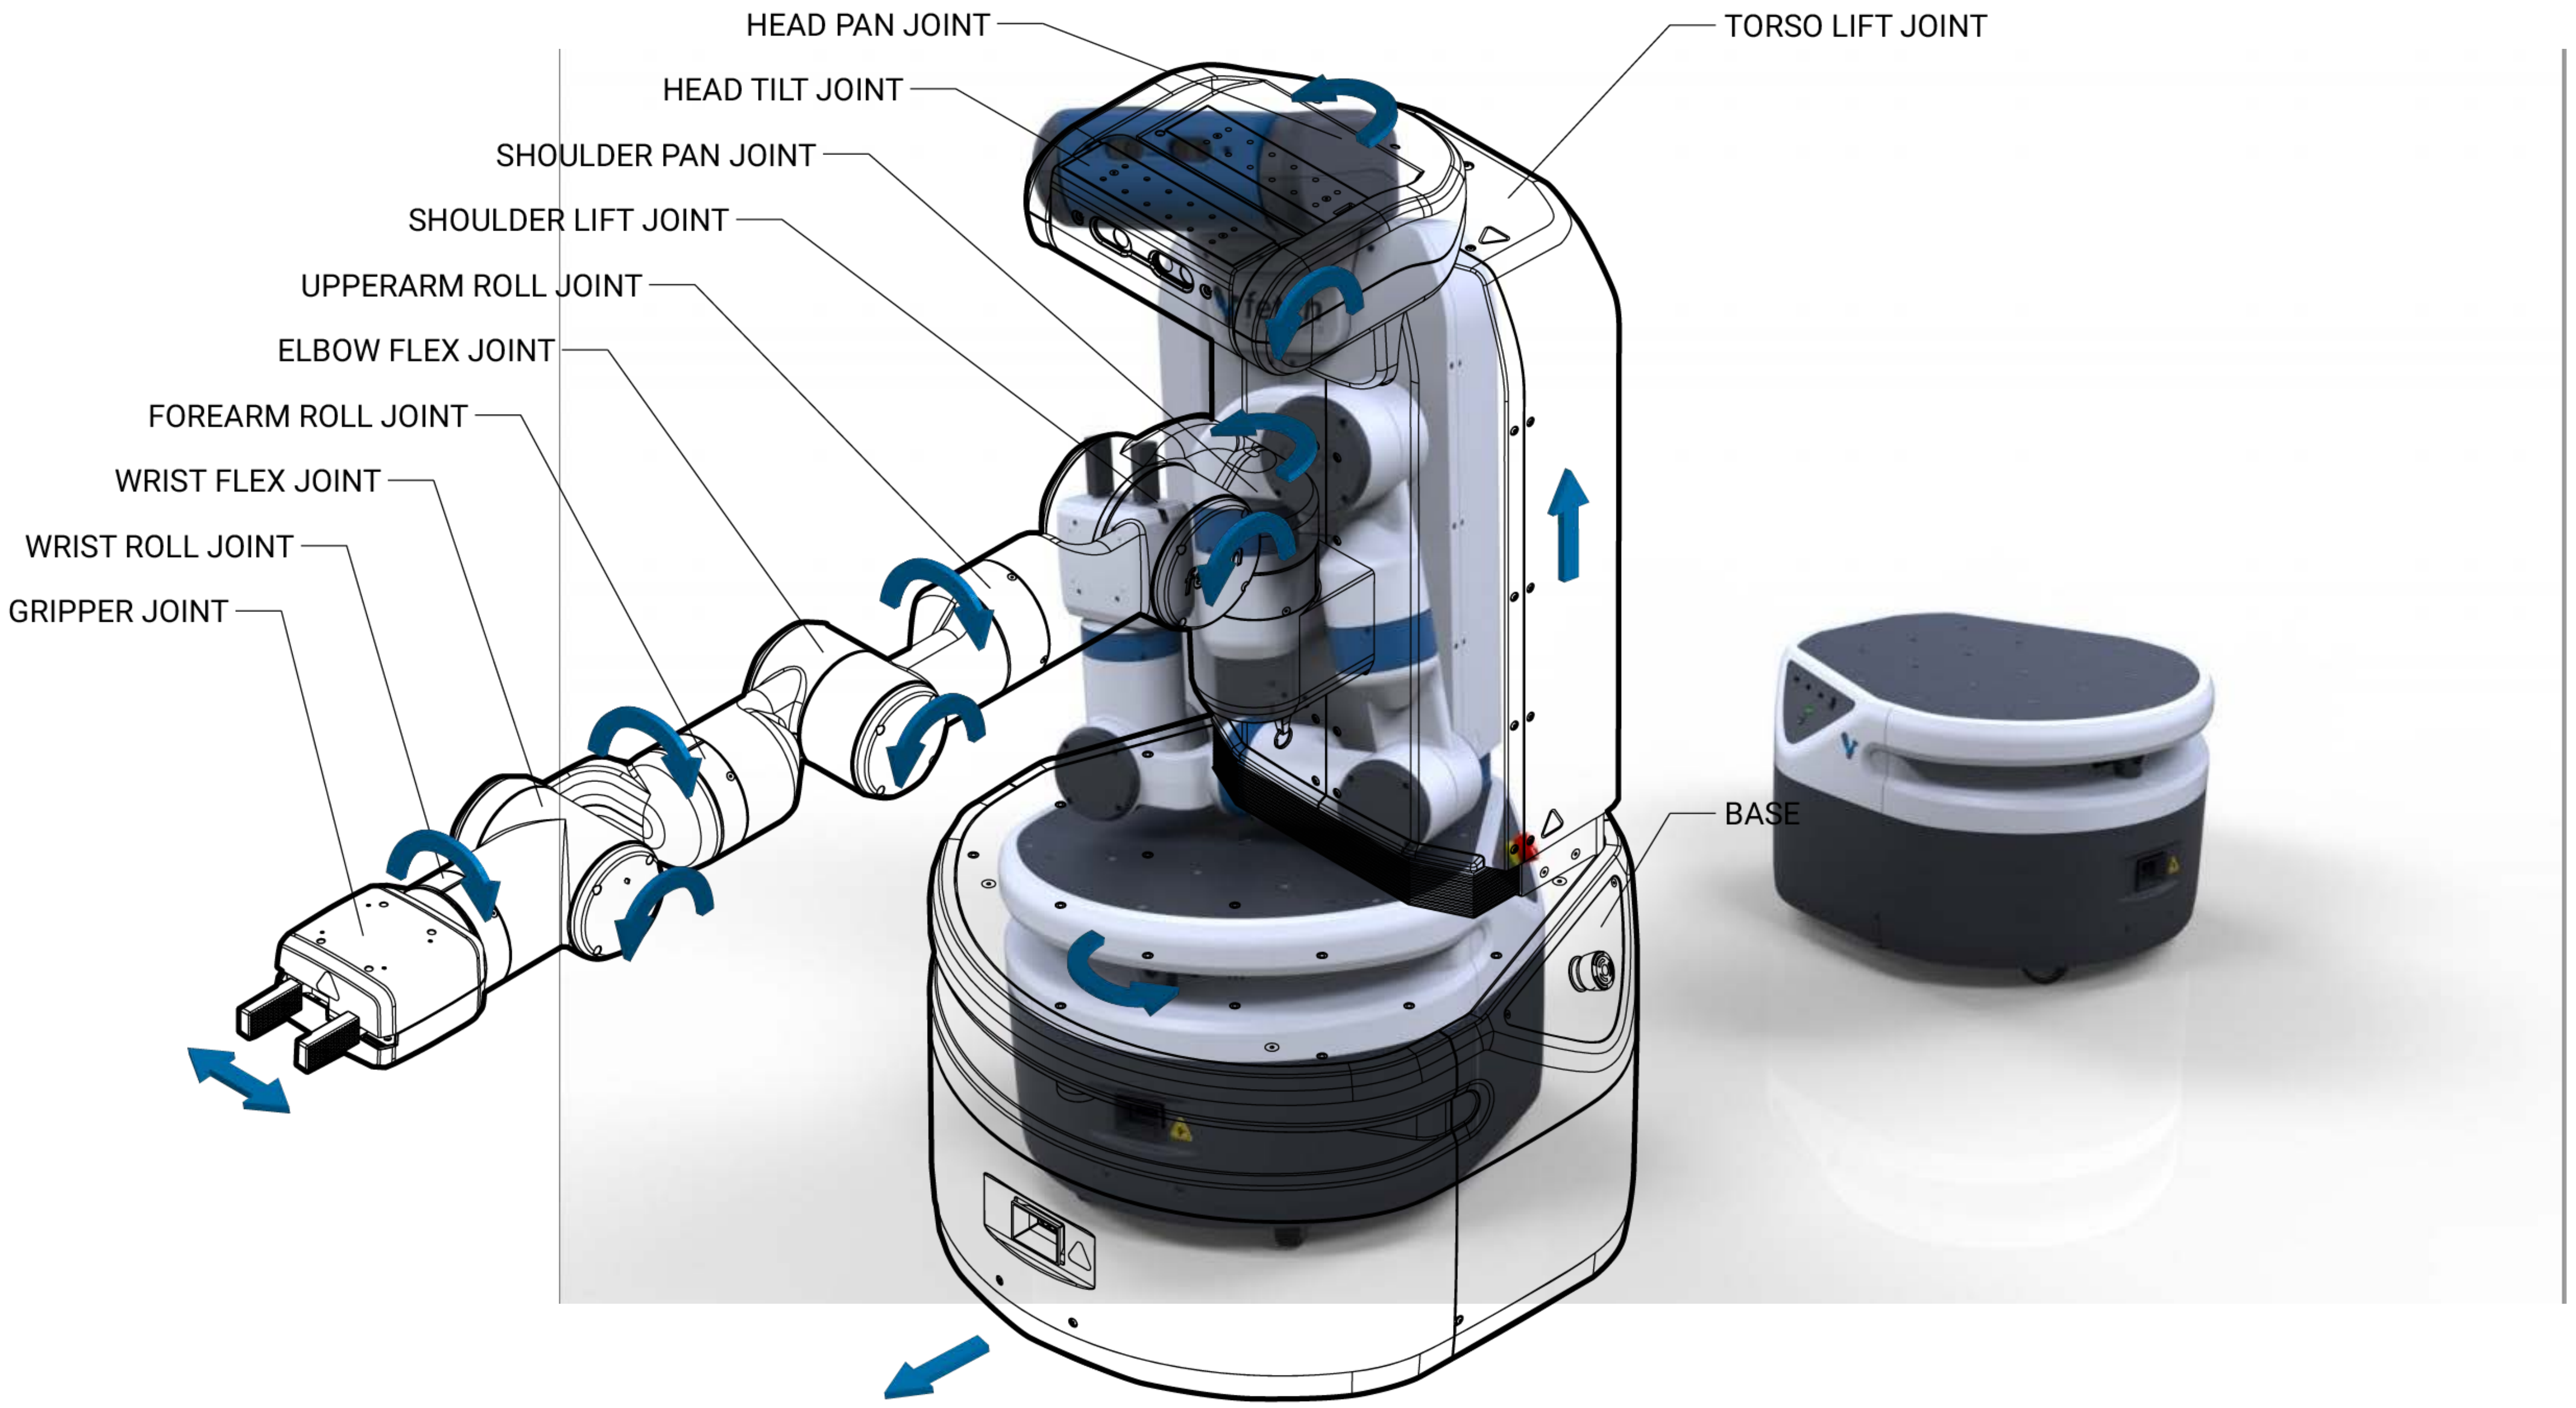
$SO(3) = S^1 \times S^1 \times S^1$

C-space examples

- What is the C-space of a Fetch robot, not including grippers?

C-space examples

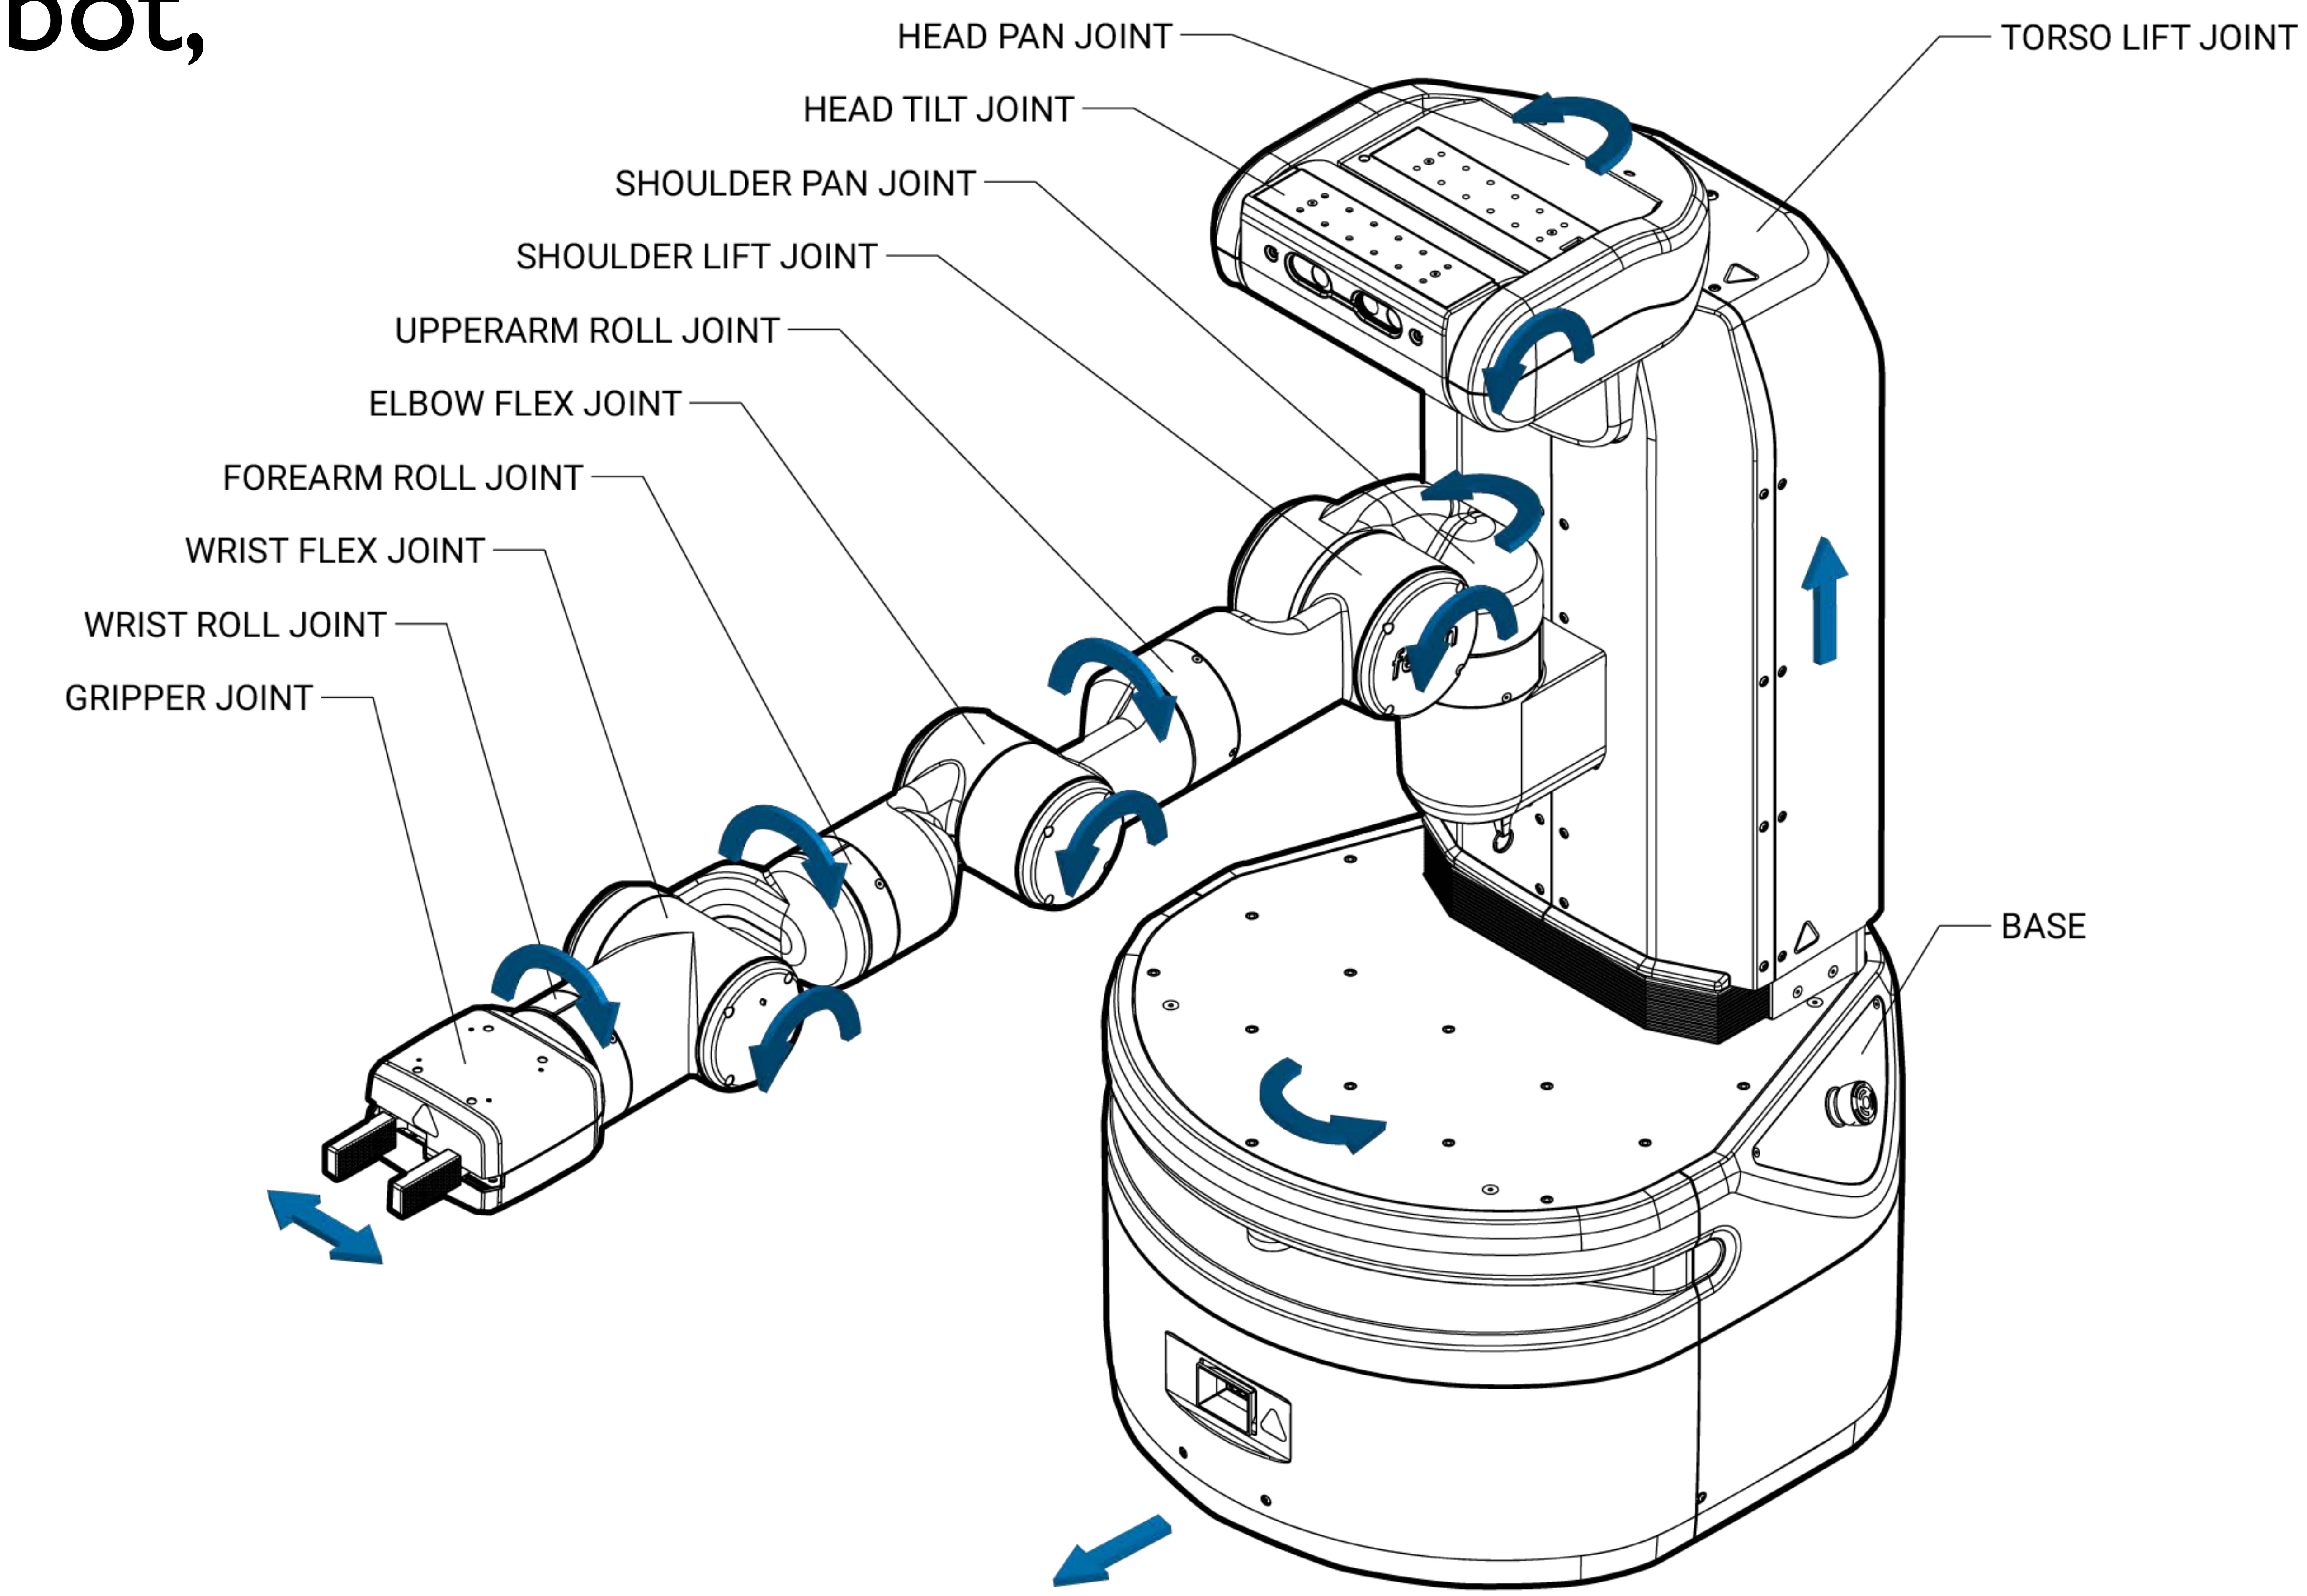
- What is the C-space of a Fetch robot, not including grippers?



Slide borrowed from Michigan Robotics autorob.org

C-space examples

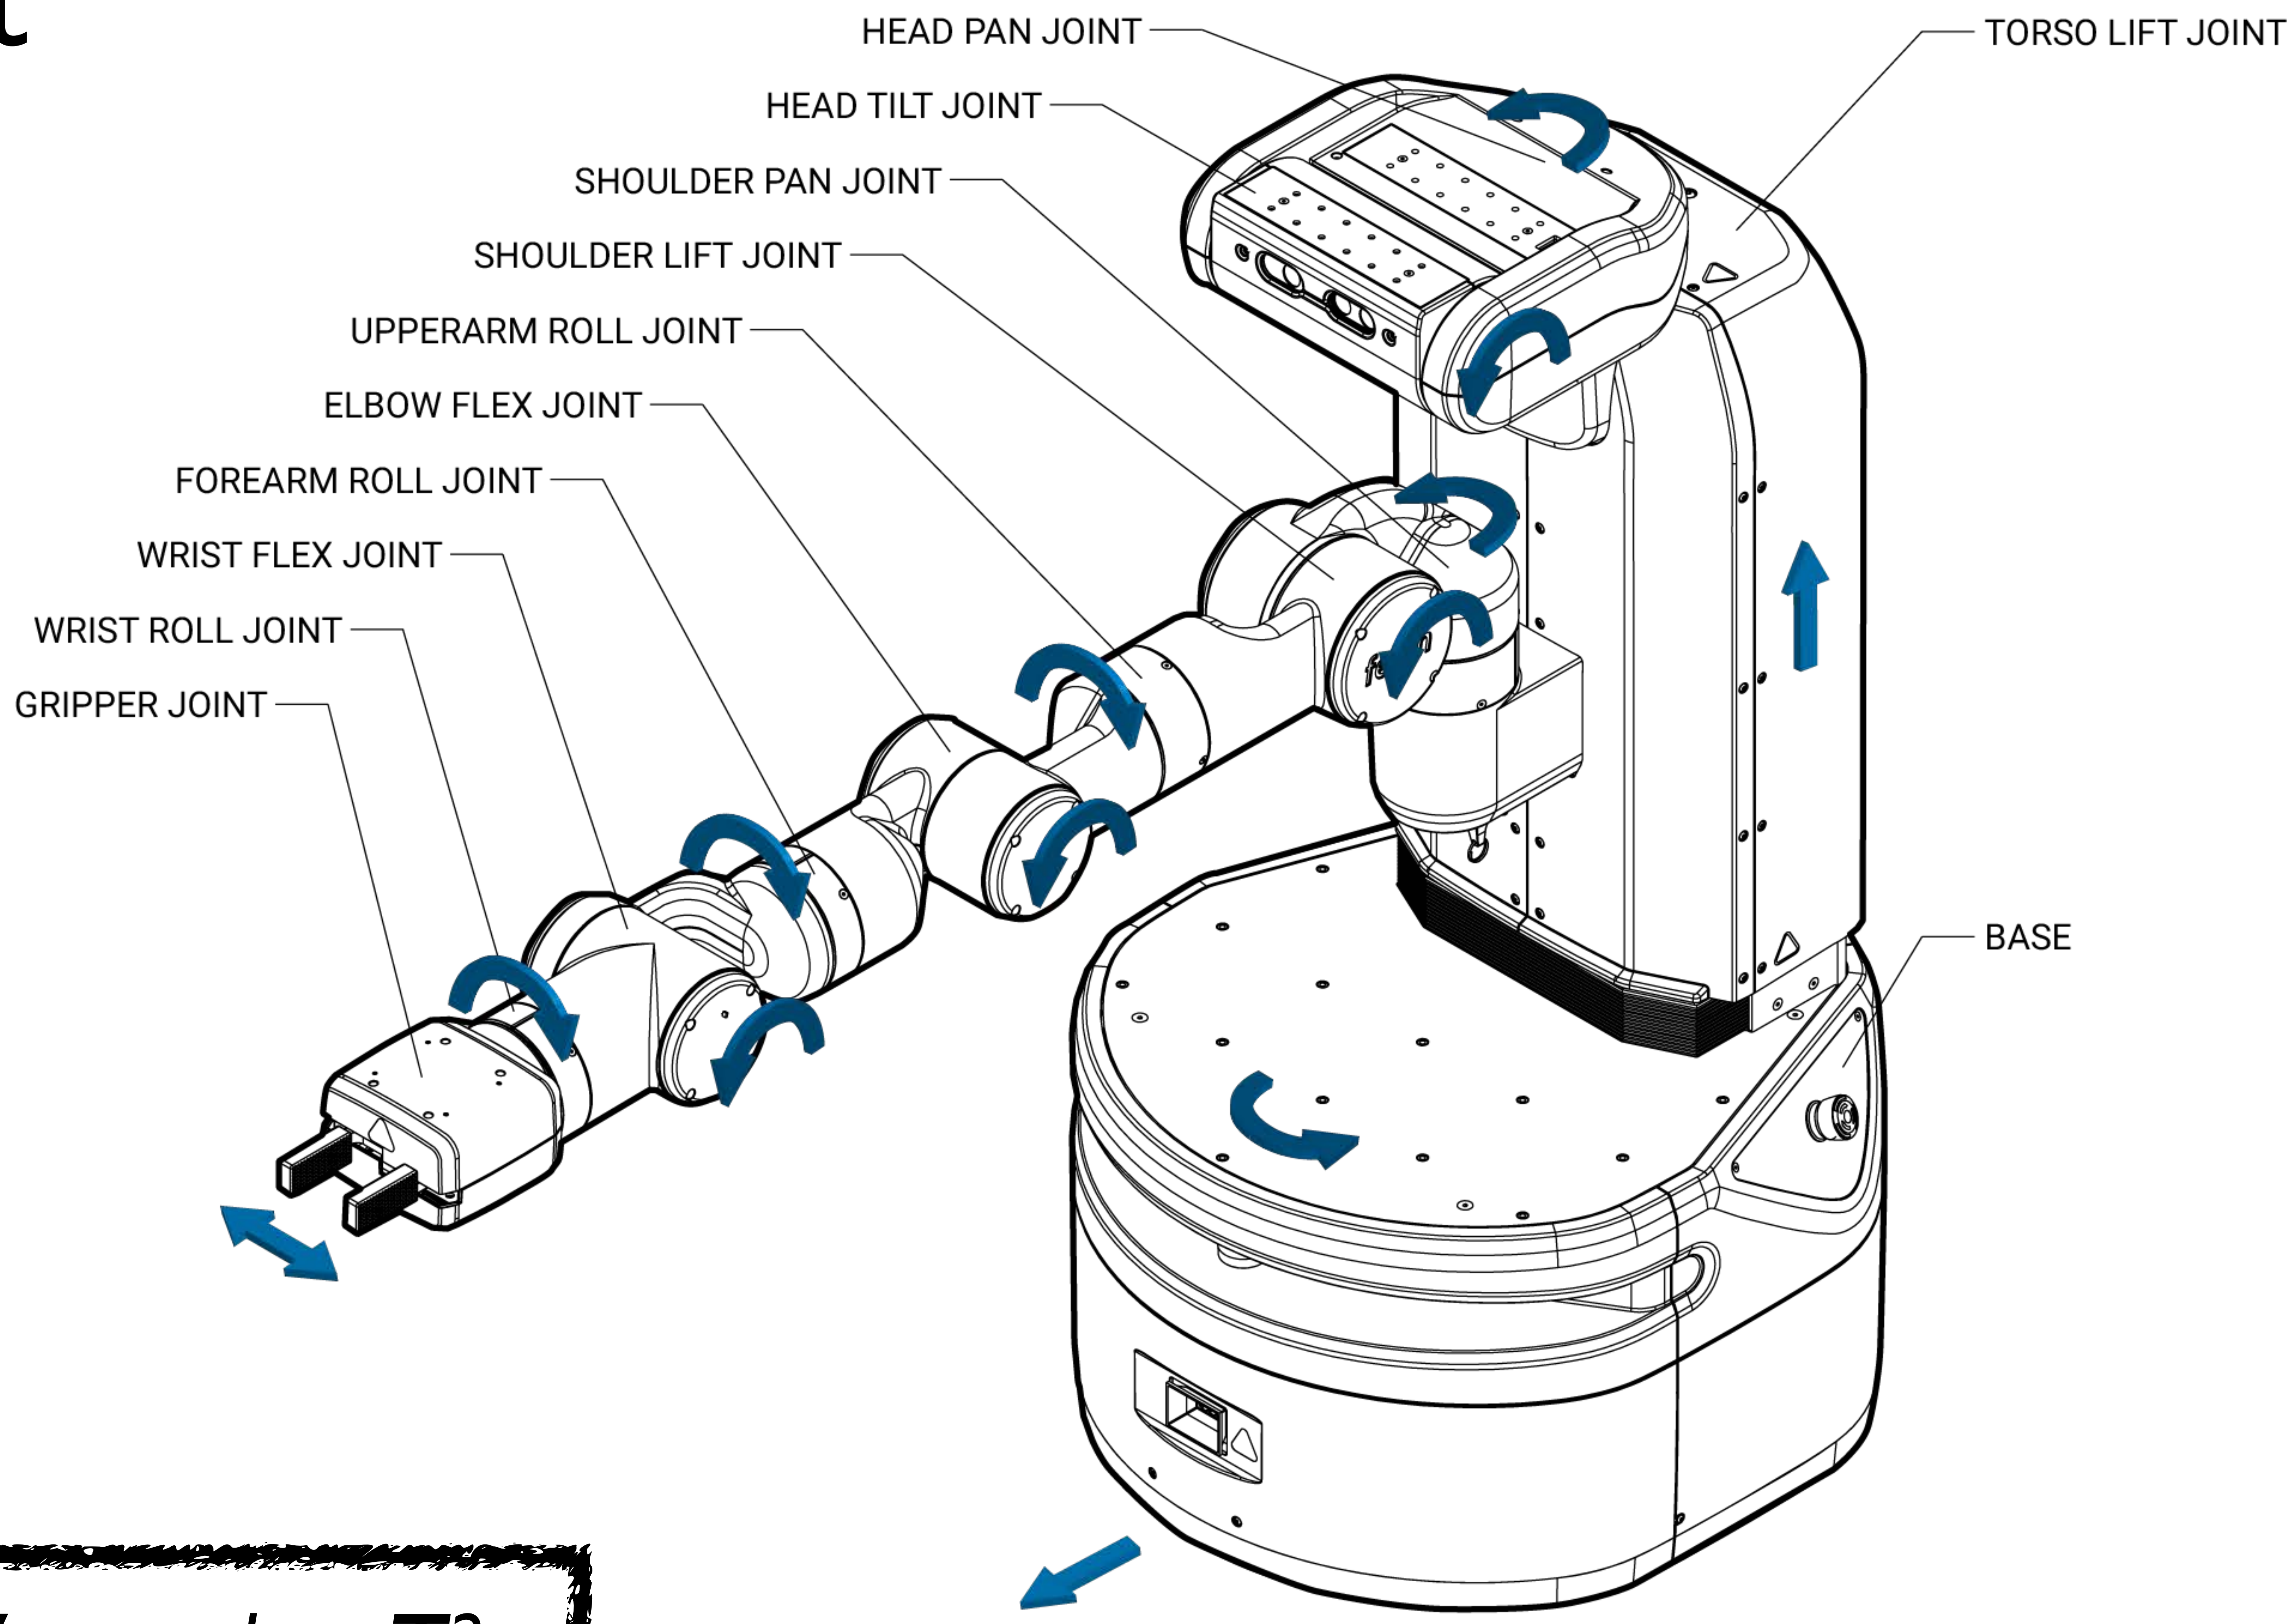
- What is the C-space of a Fetch robot, not including grippers?



Slide borrowed from Michigan Robotics autorob.org

C-space examples

- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
  - 3 in base: $SE(2)$
  - 7 in arm: T^7
  - 1 in the spine: $\Re^1$
  - 2 in neck: T^2

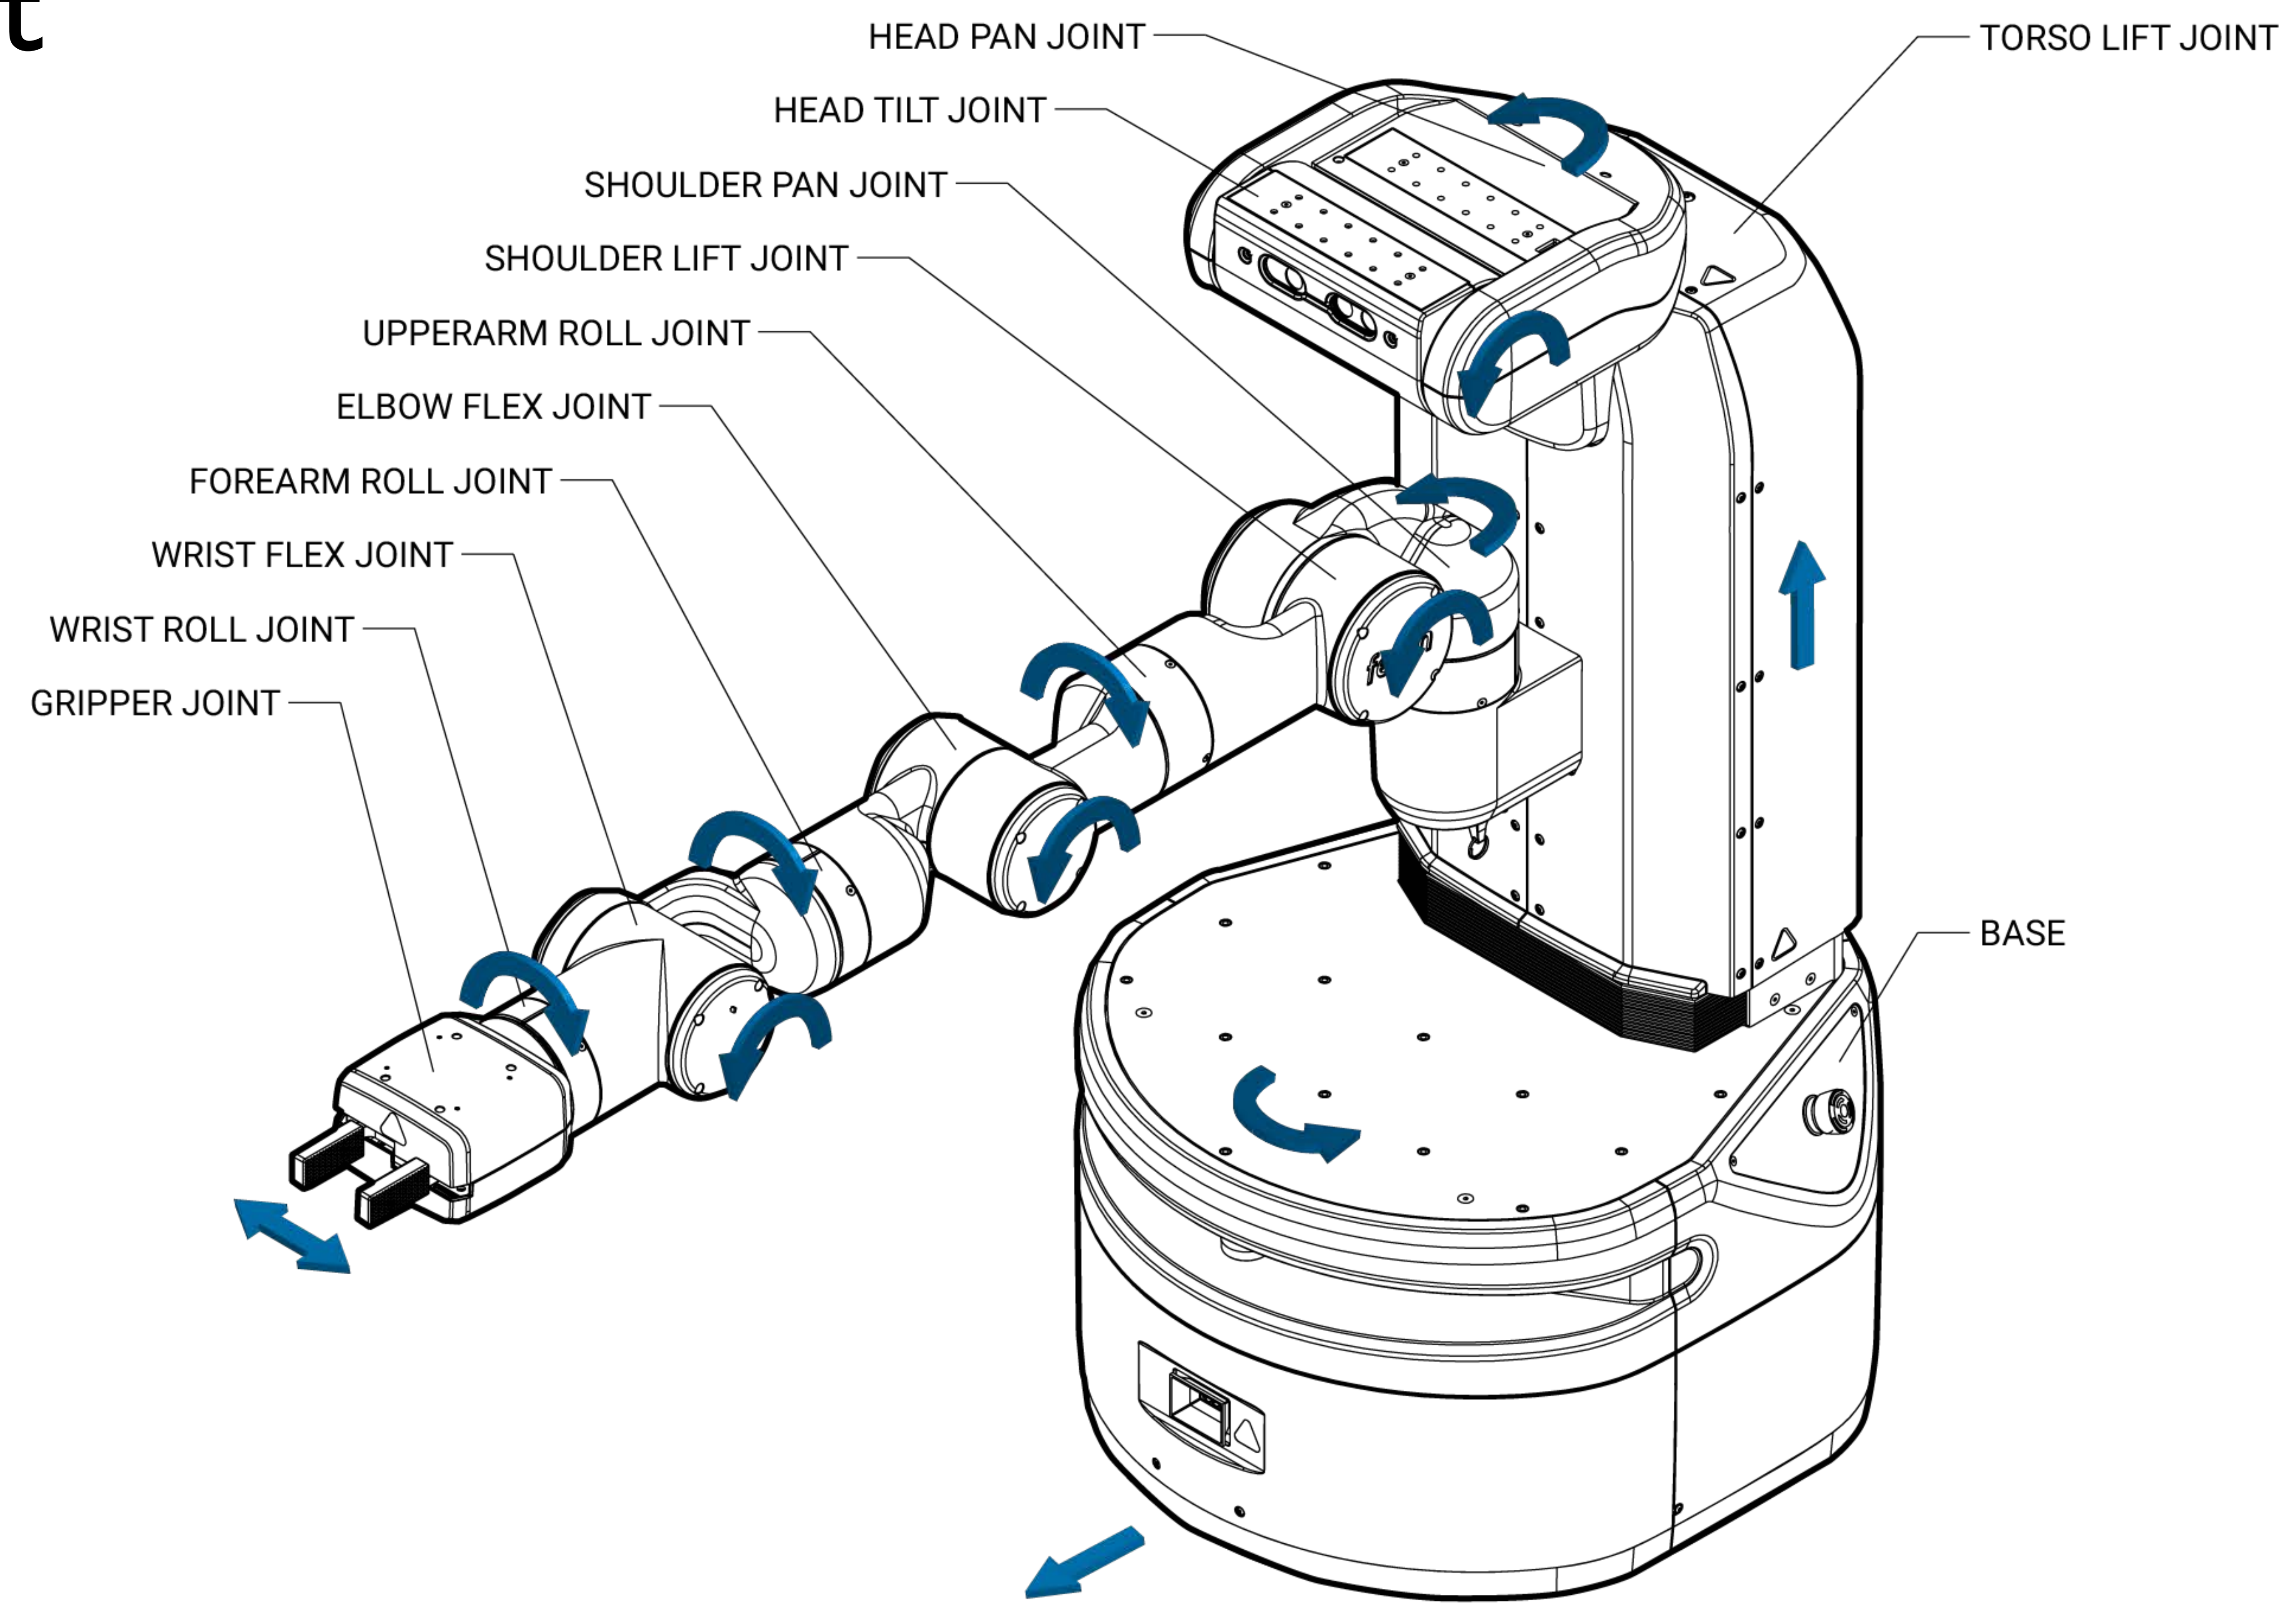


C-space: $SE(2) \times T^7 \times \Re^1 \times T^2$

Did we get this wrong?

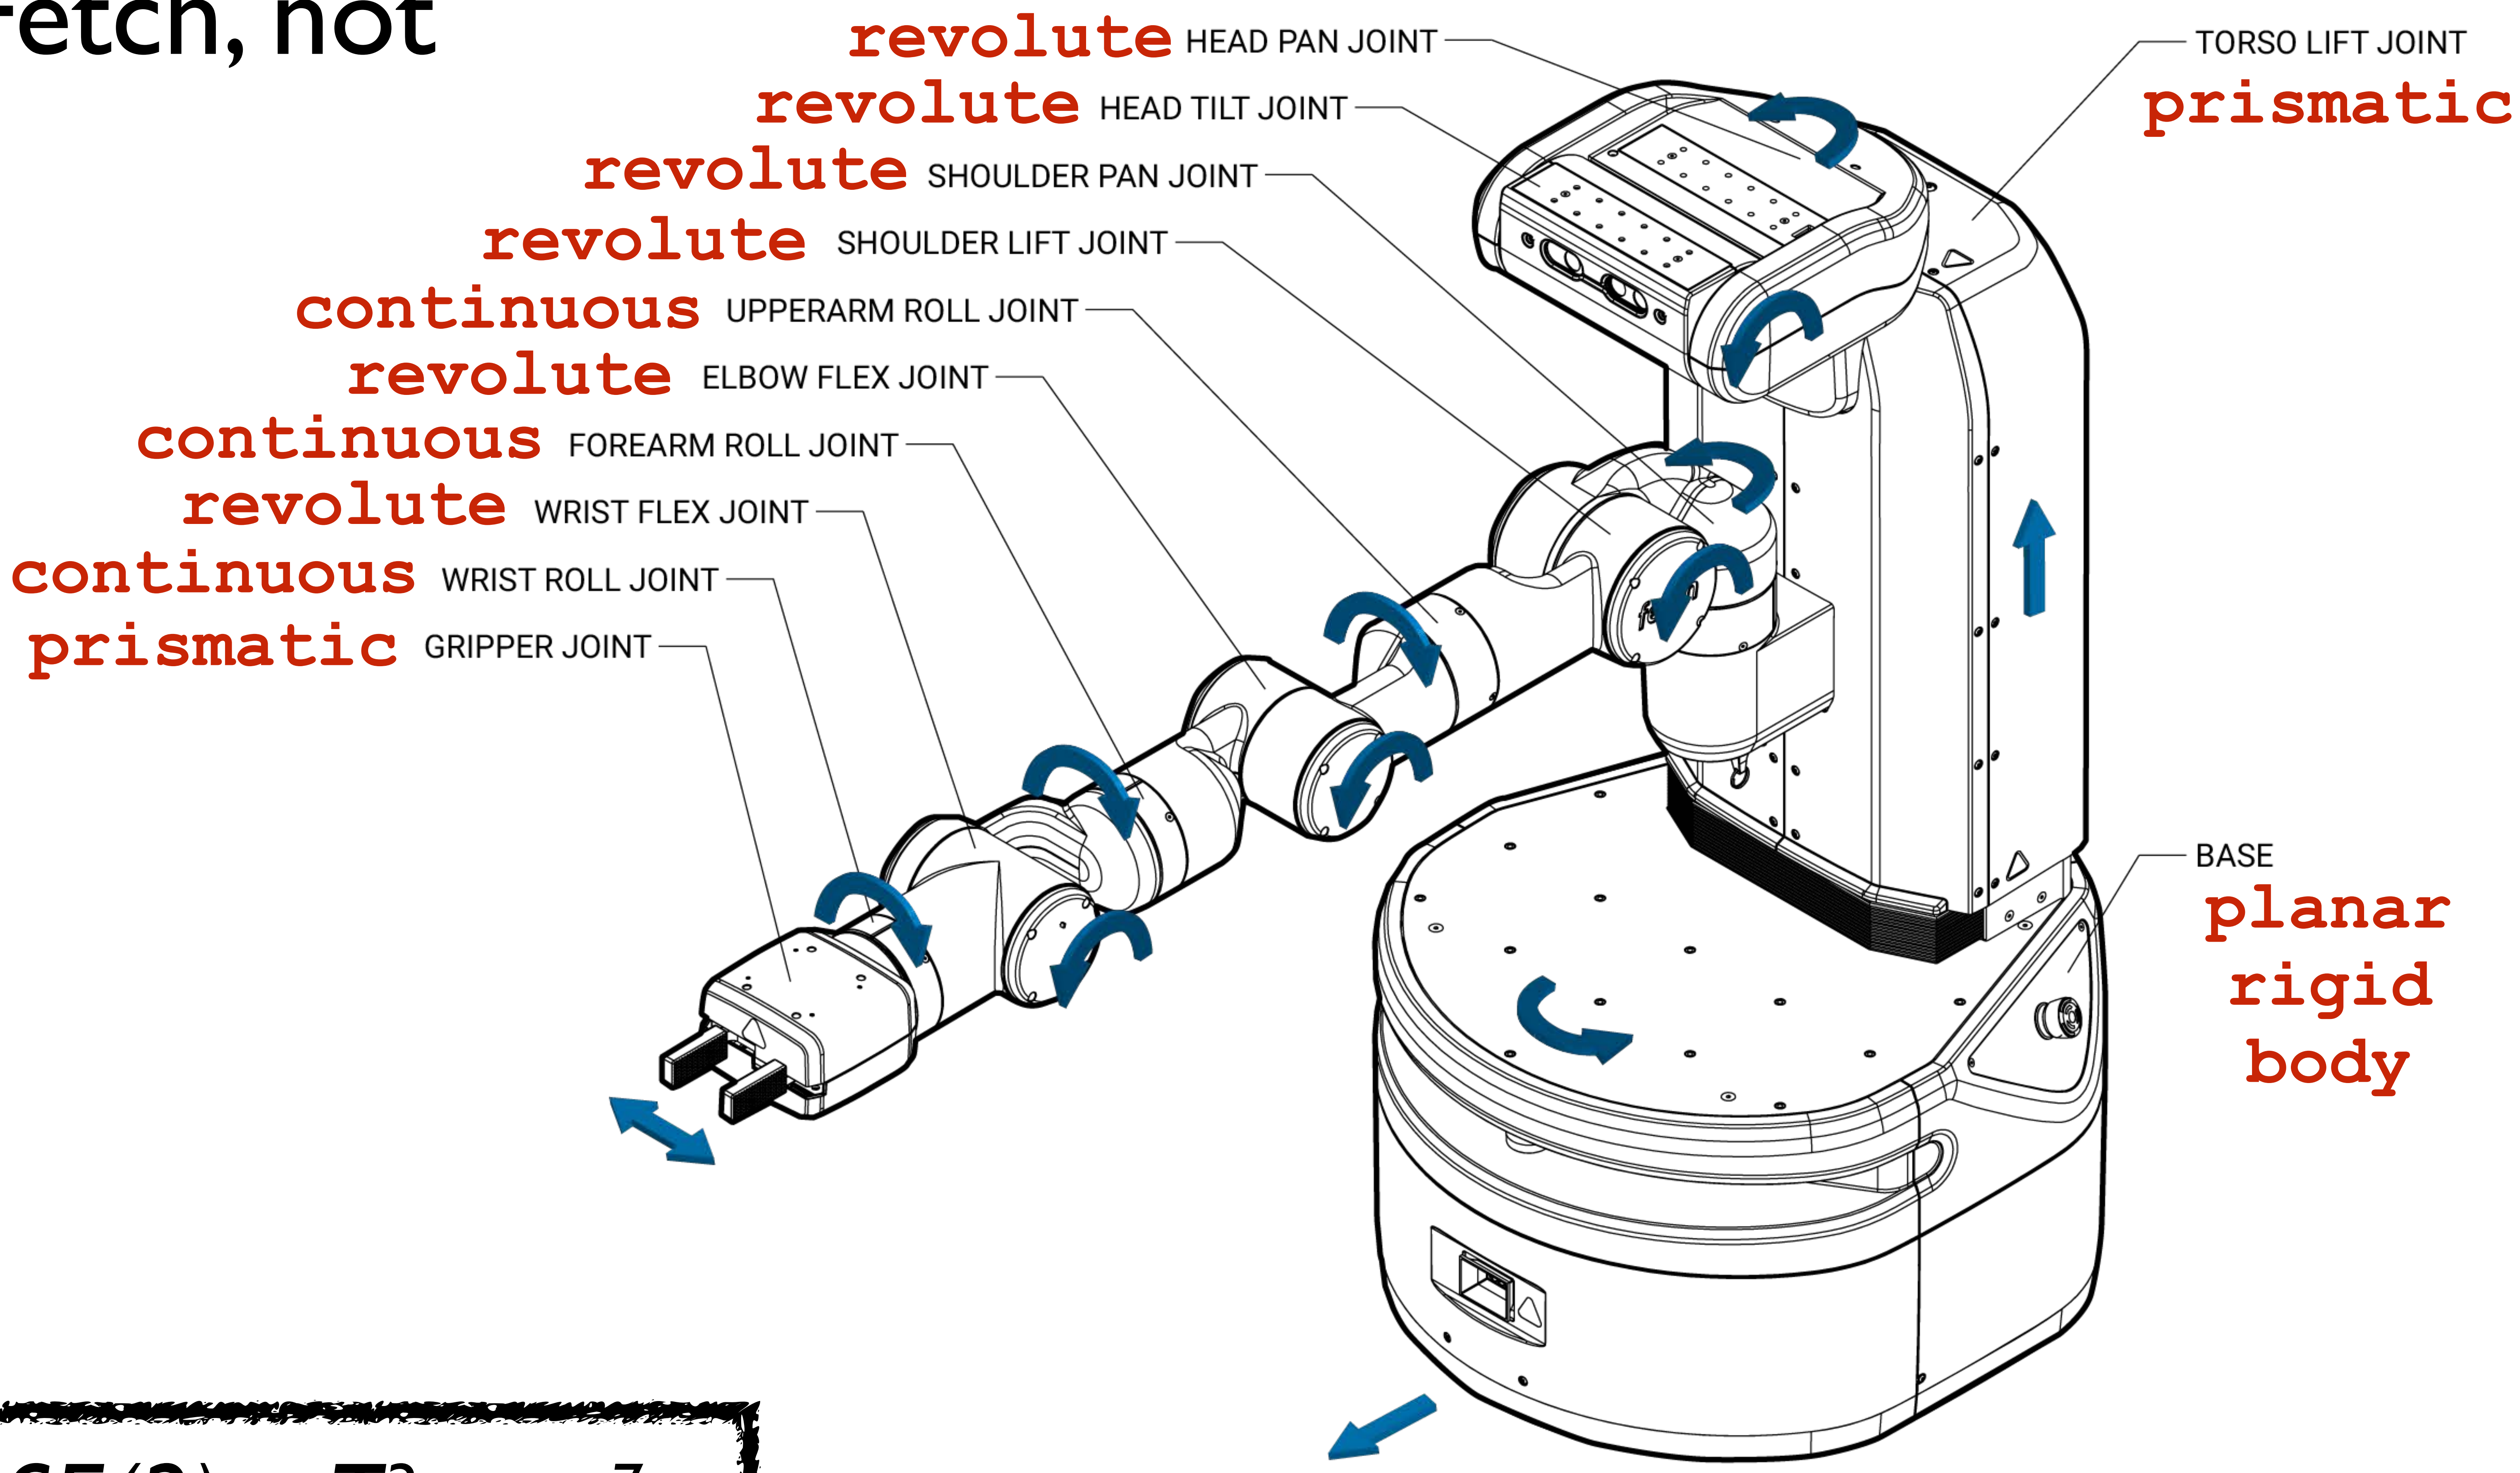
- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
  - 3 in base: *SE(2)*
  - 7 in arm: ~~T^7~~
  - 1 in the spine: $\Re^1$
  - 2 in neck: ~~T^2~~

Consider joint limits



Slide borrowed from Michigan Robotics autorob.org

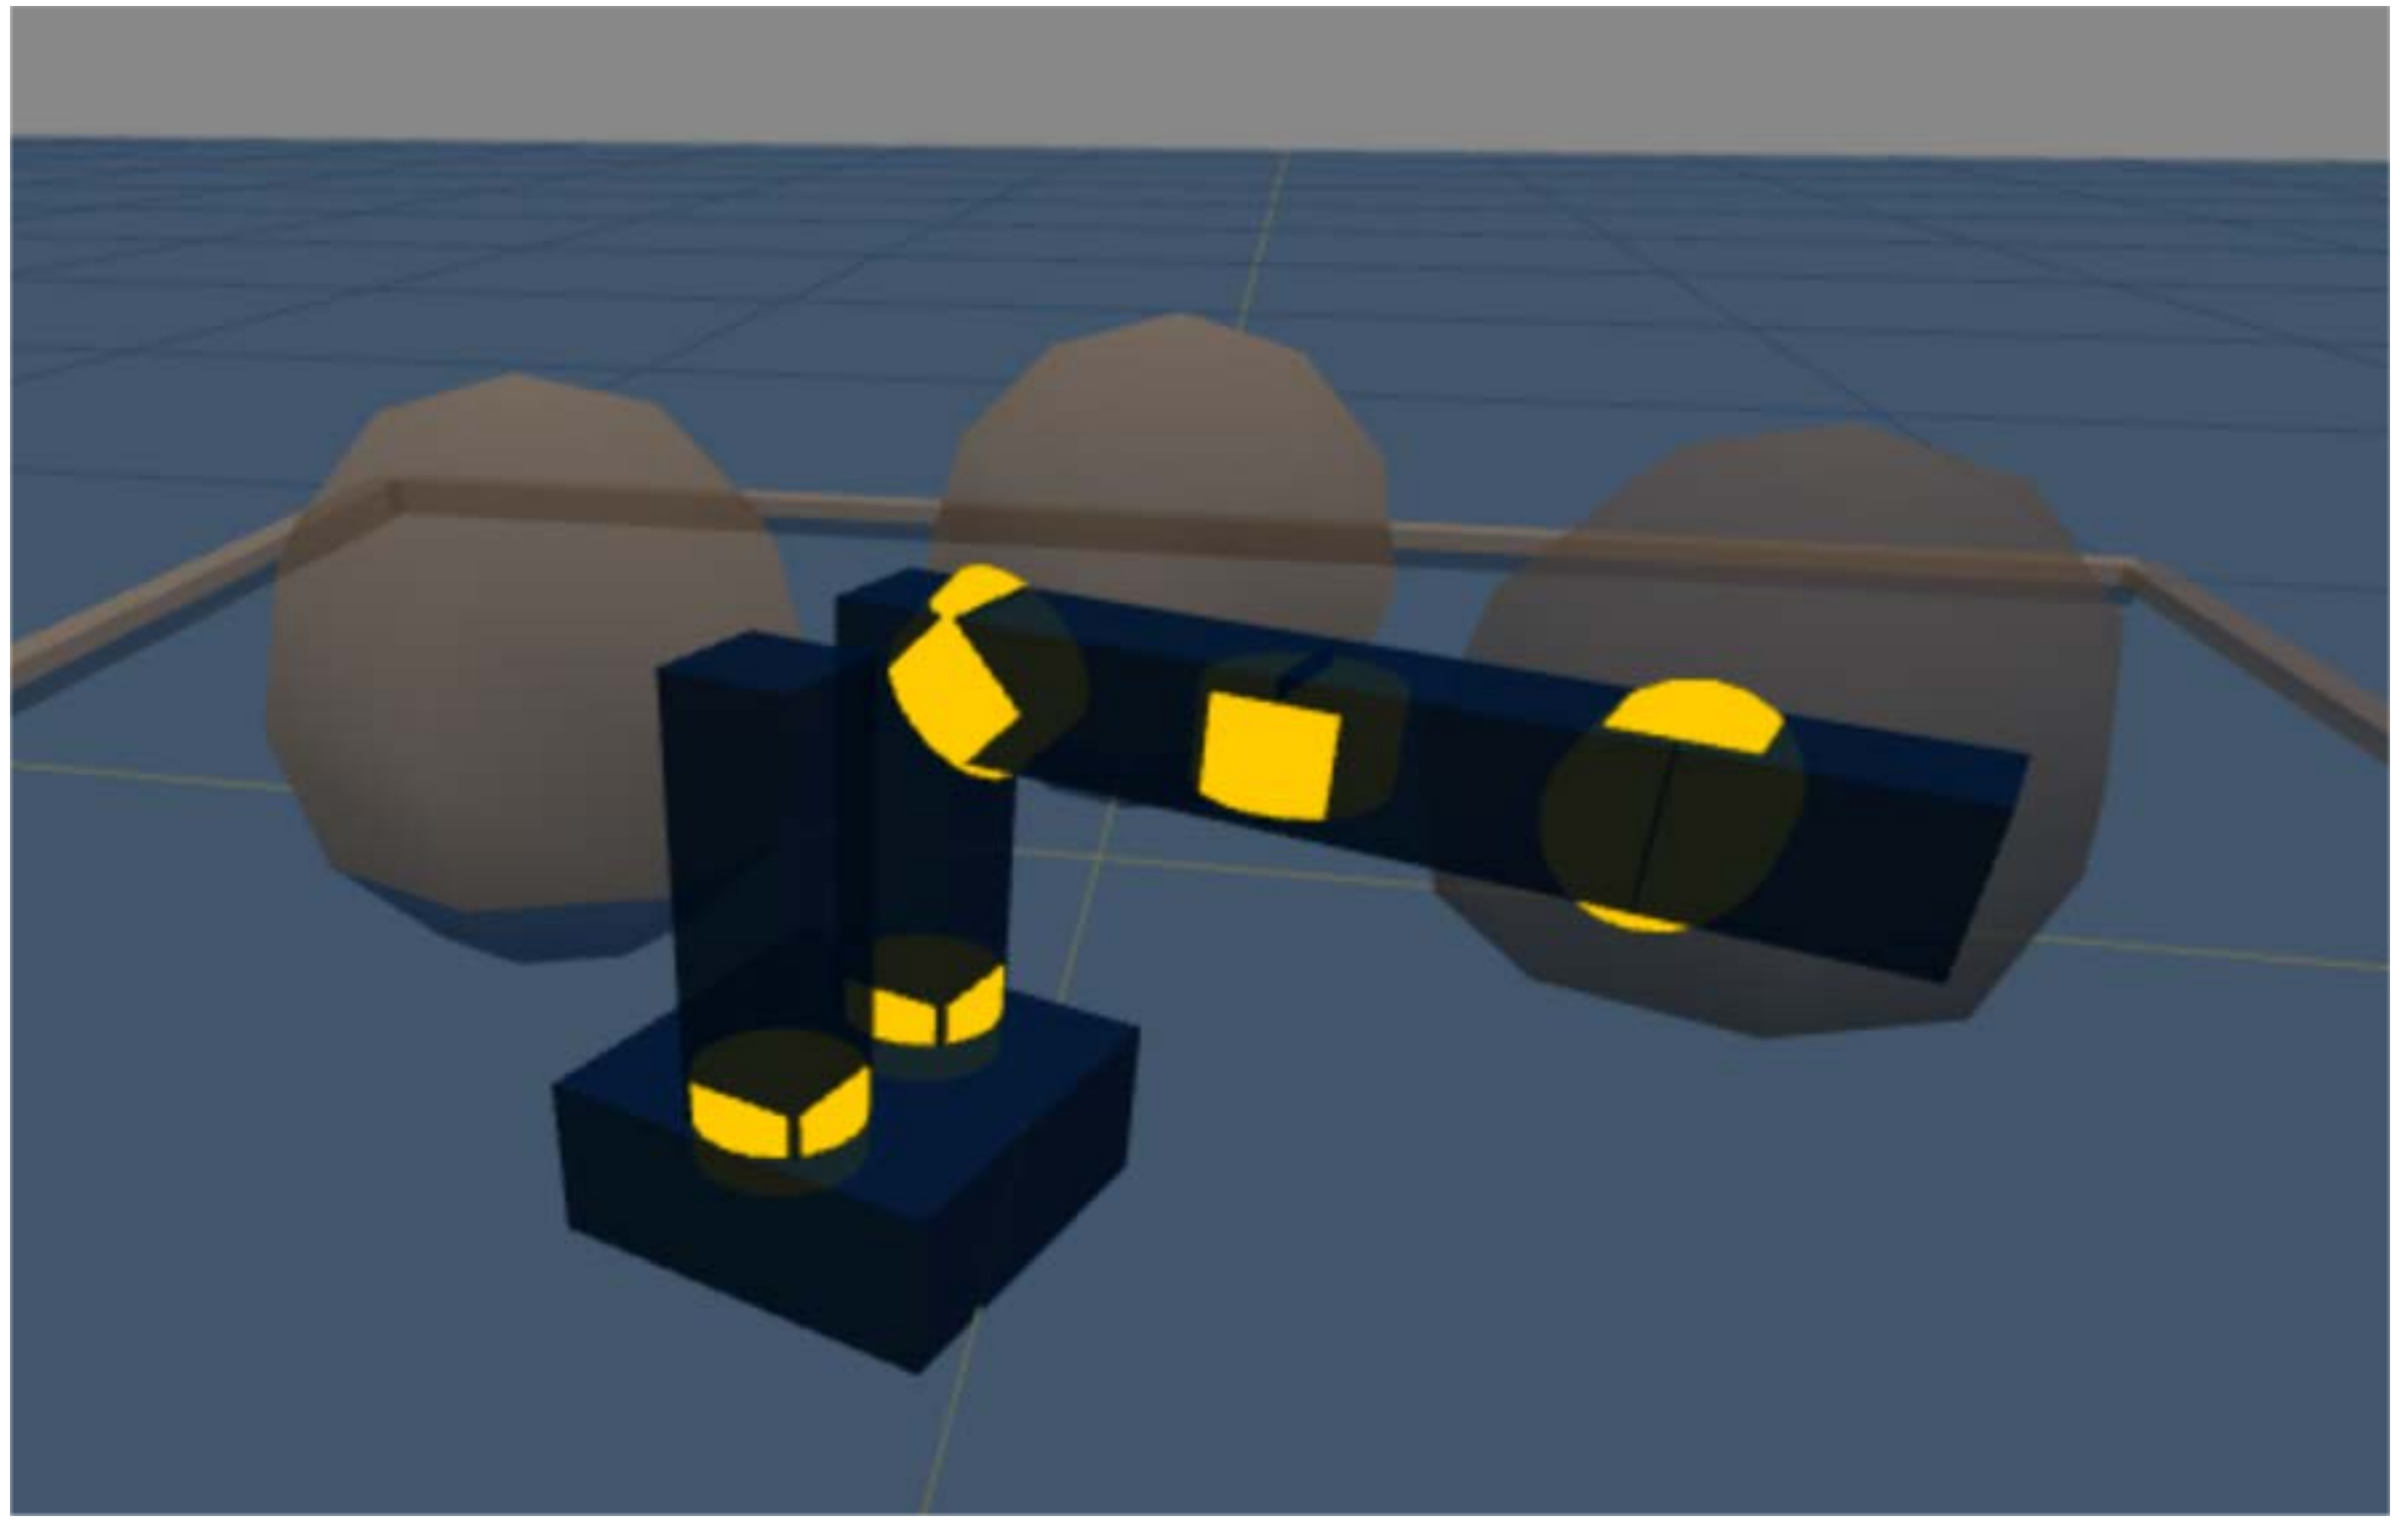
- What is the C-space of a Fetch, not including grippers?
- DOFs: 13
  - 3 in base: $SE(2)$
  - 3 continuous: T^3
  - 1 prismatic: $\Re^1$
  - 6 revolute: $\Re^6$



C-space: $SE(2) \times T^3 \times \Re^7$

C-space examples

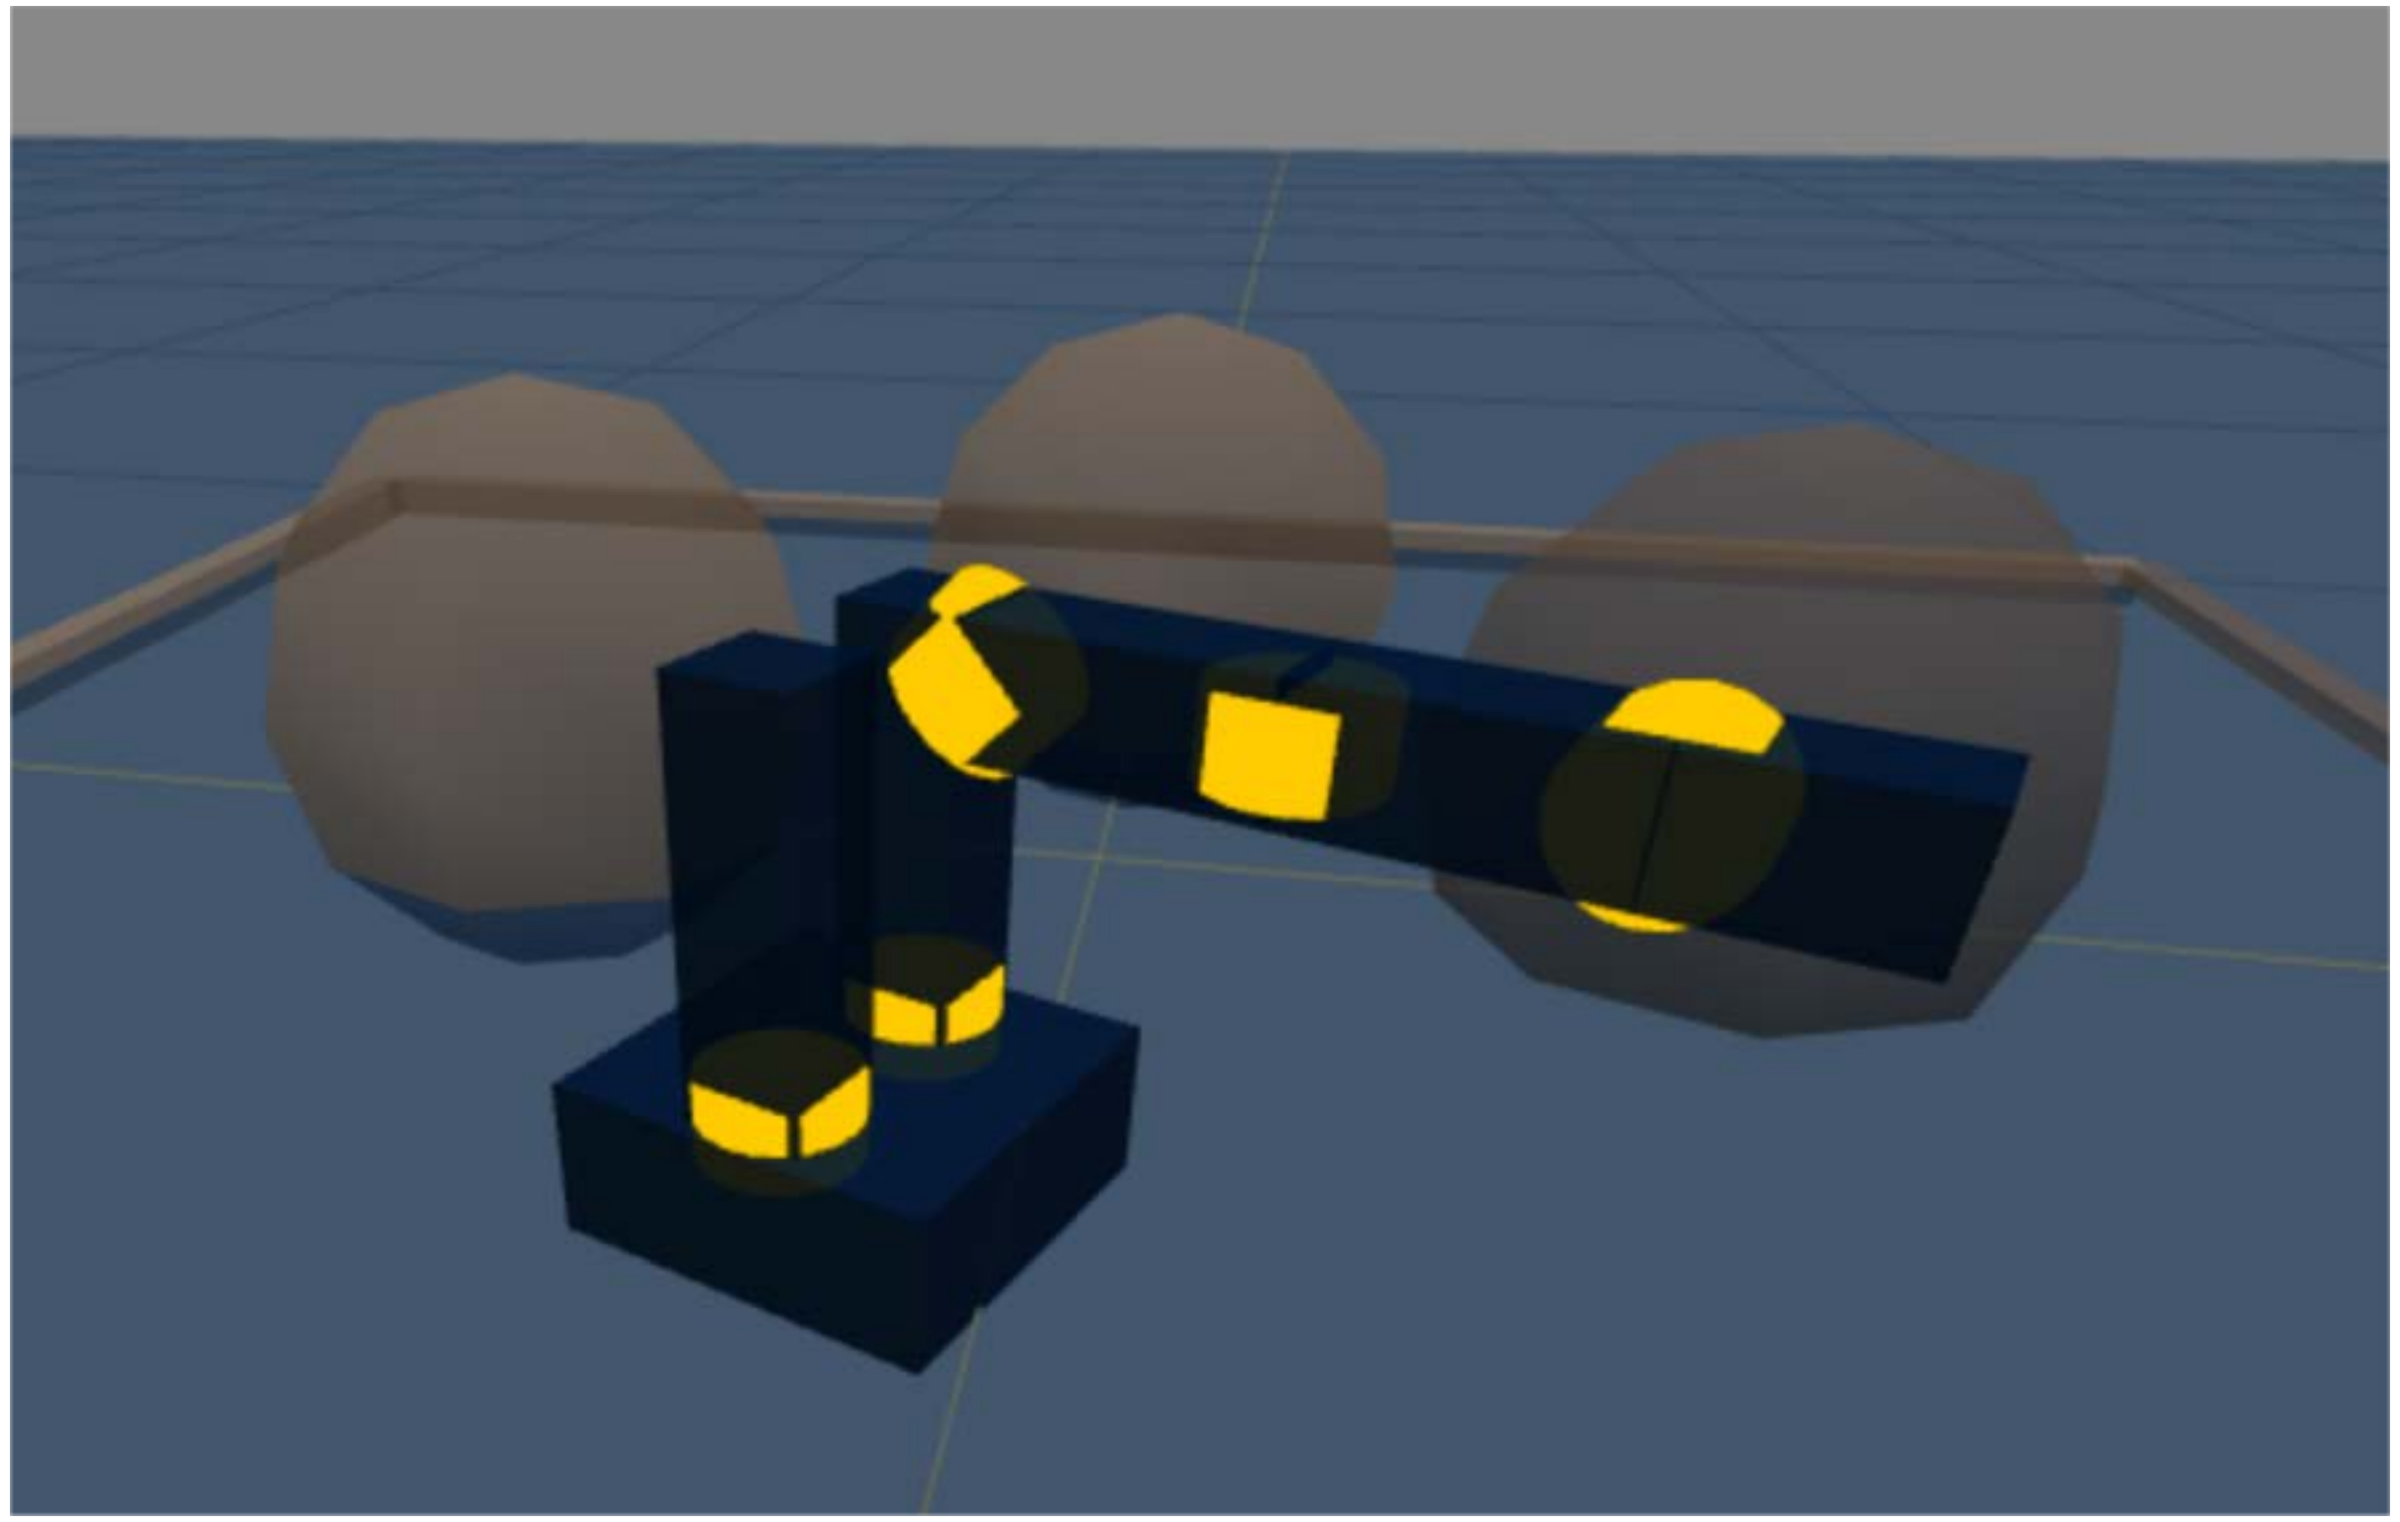
- What is the C-space of a MR2?



C-space examples

- What is the C-space of a MR2?
- DOFs: 8
  - 3 in base: $SE(2)$
  - 5 in arms: T^5

C-space: $SE(2) \times T^5$



C-space examples

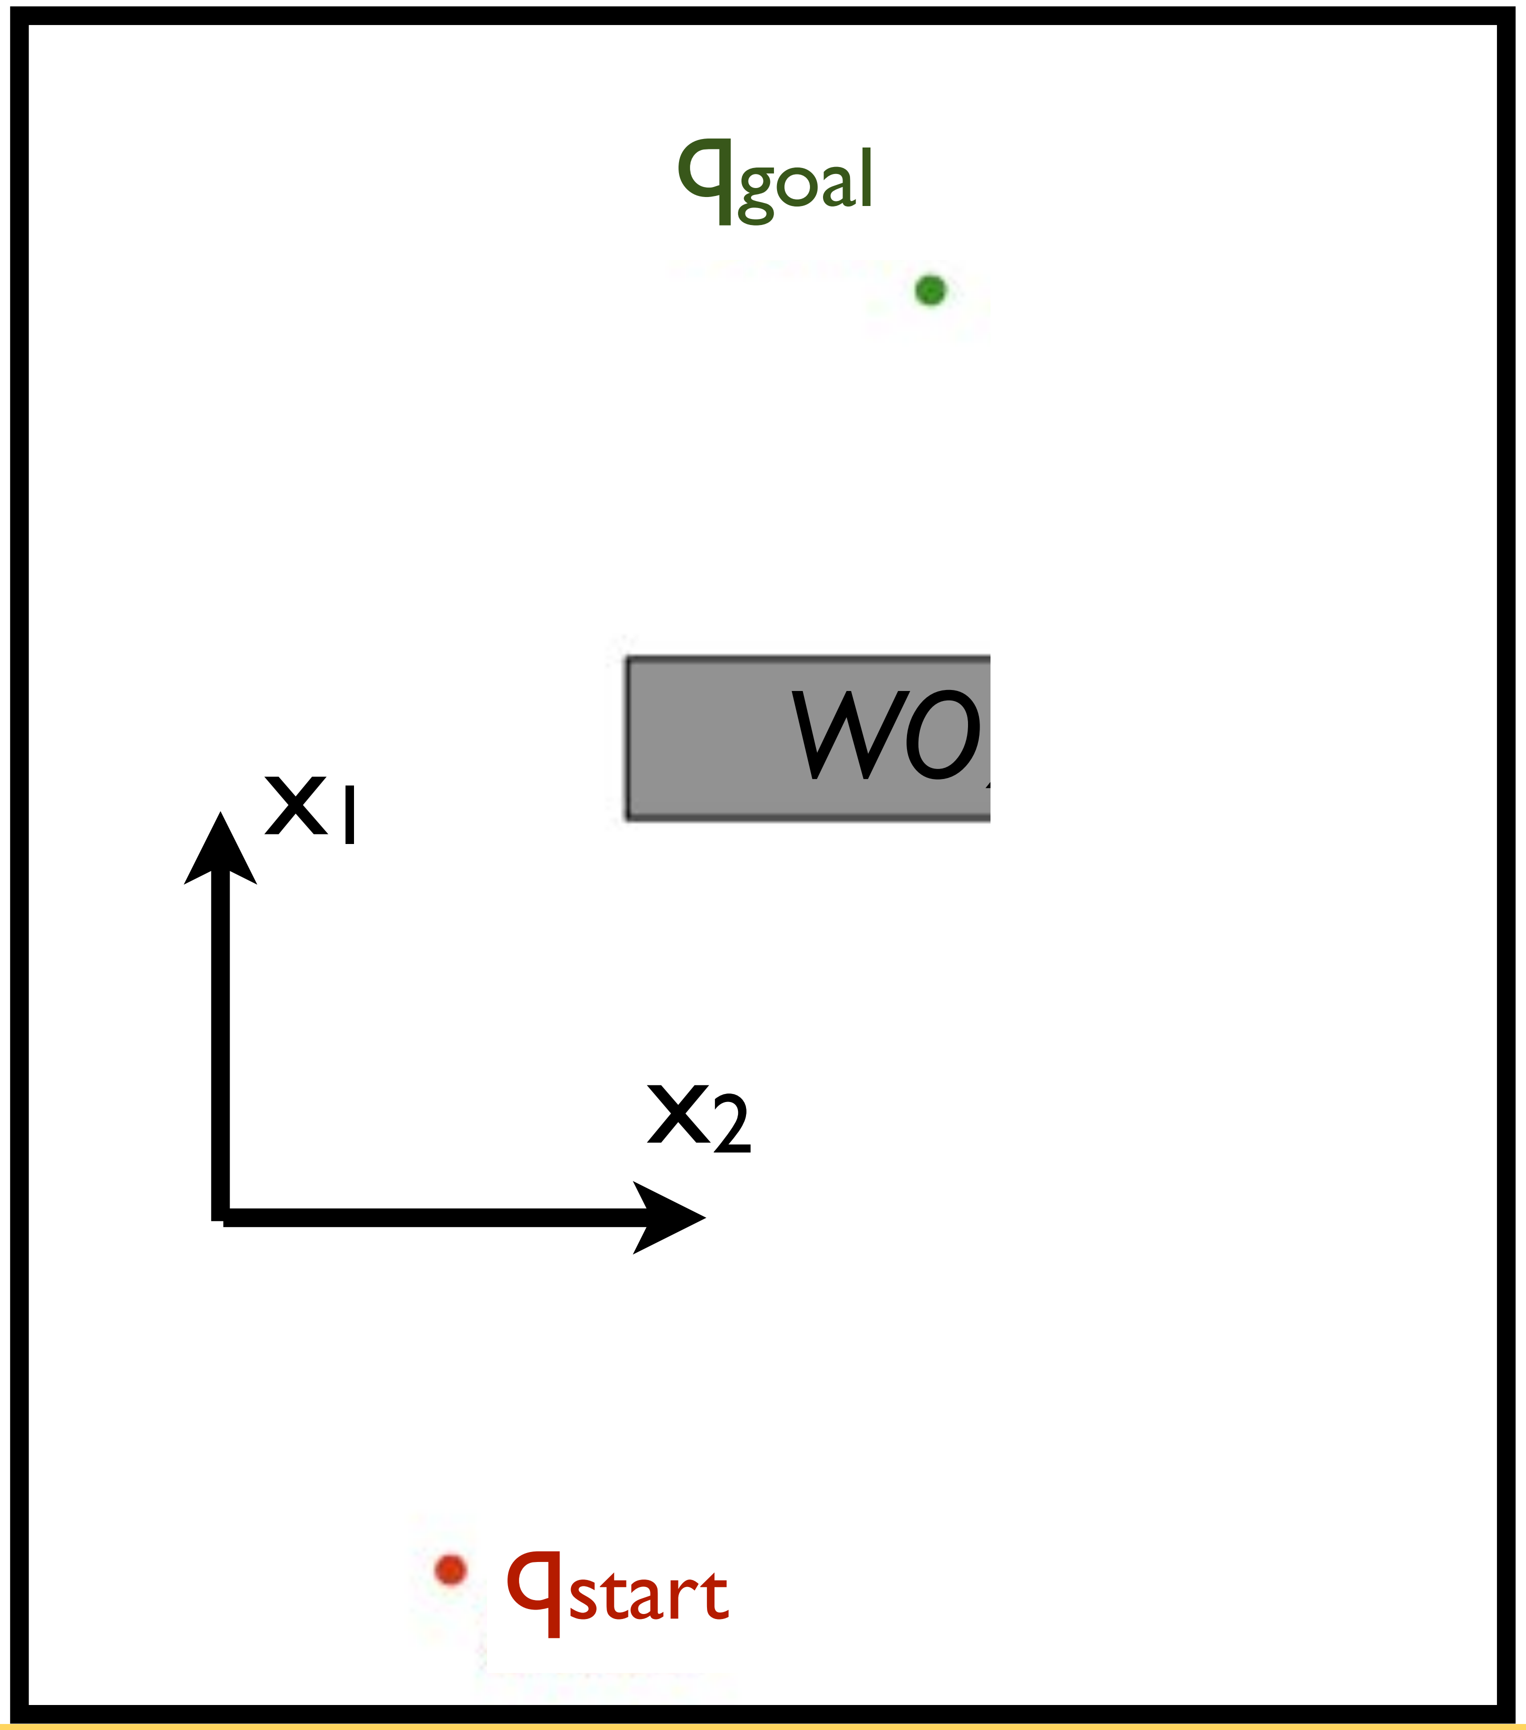
- What is the C-space of a Robonaut 2 on the International Space Station?

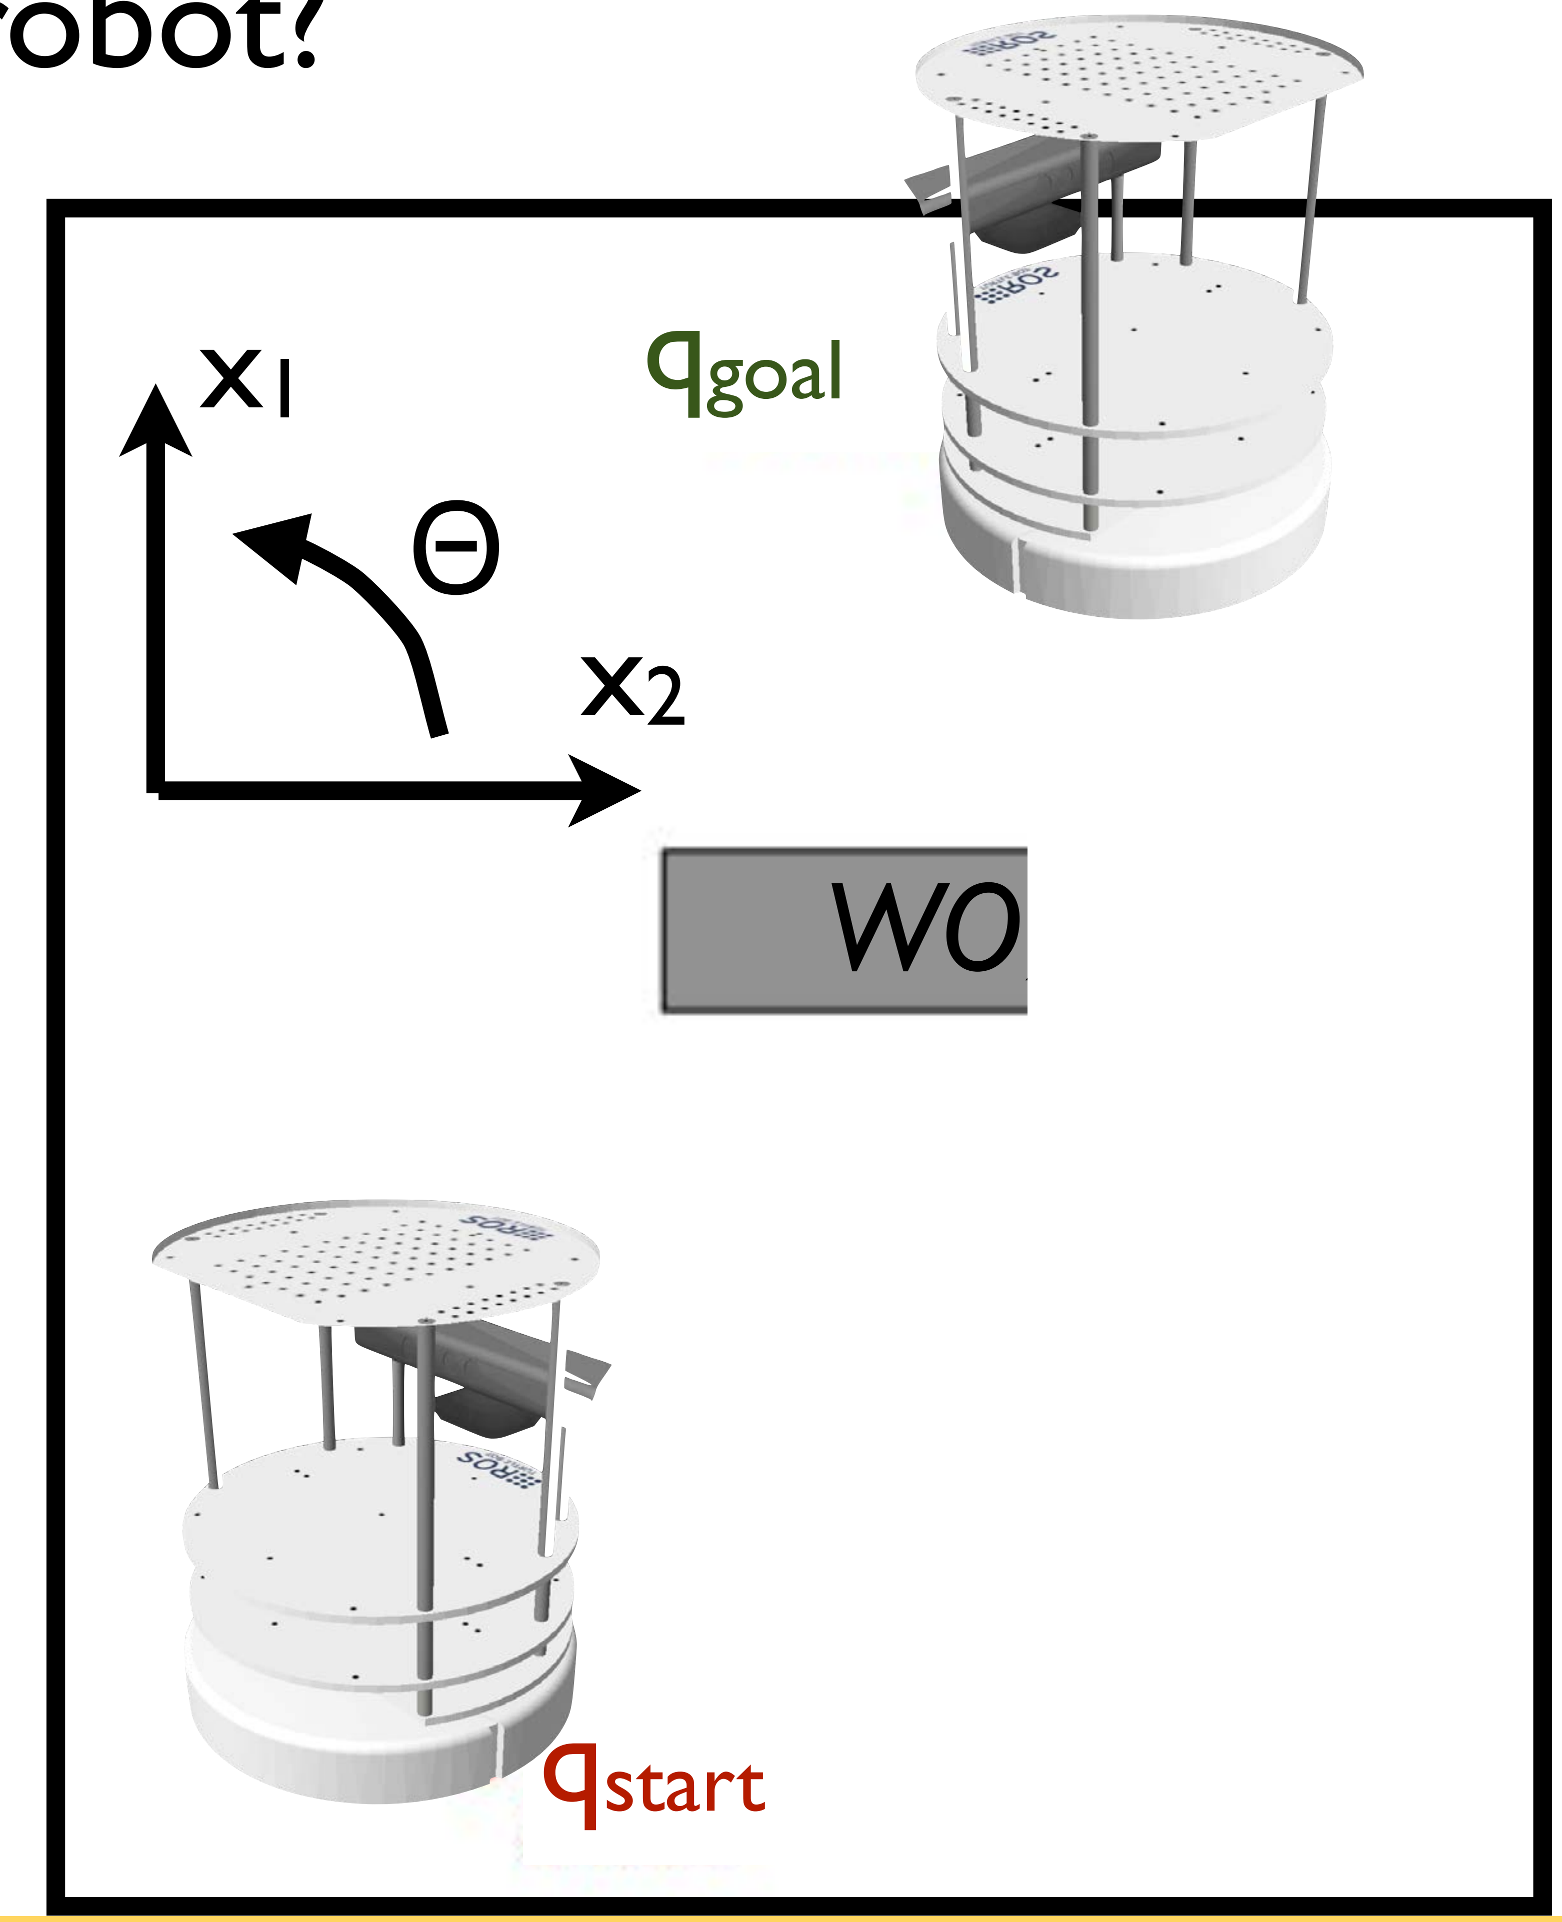
- What is the C-space of a PR2?

What about the robot's physical geometry?

Configuration v. Workspaces

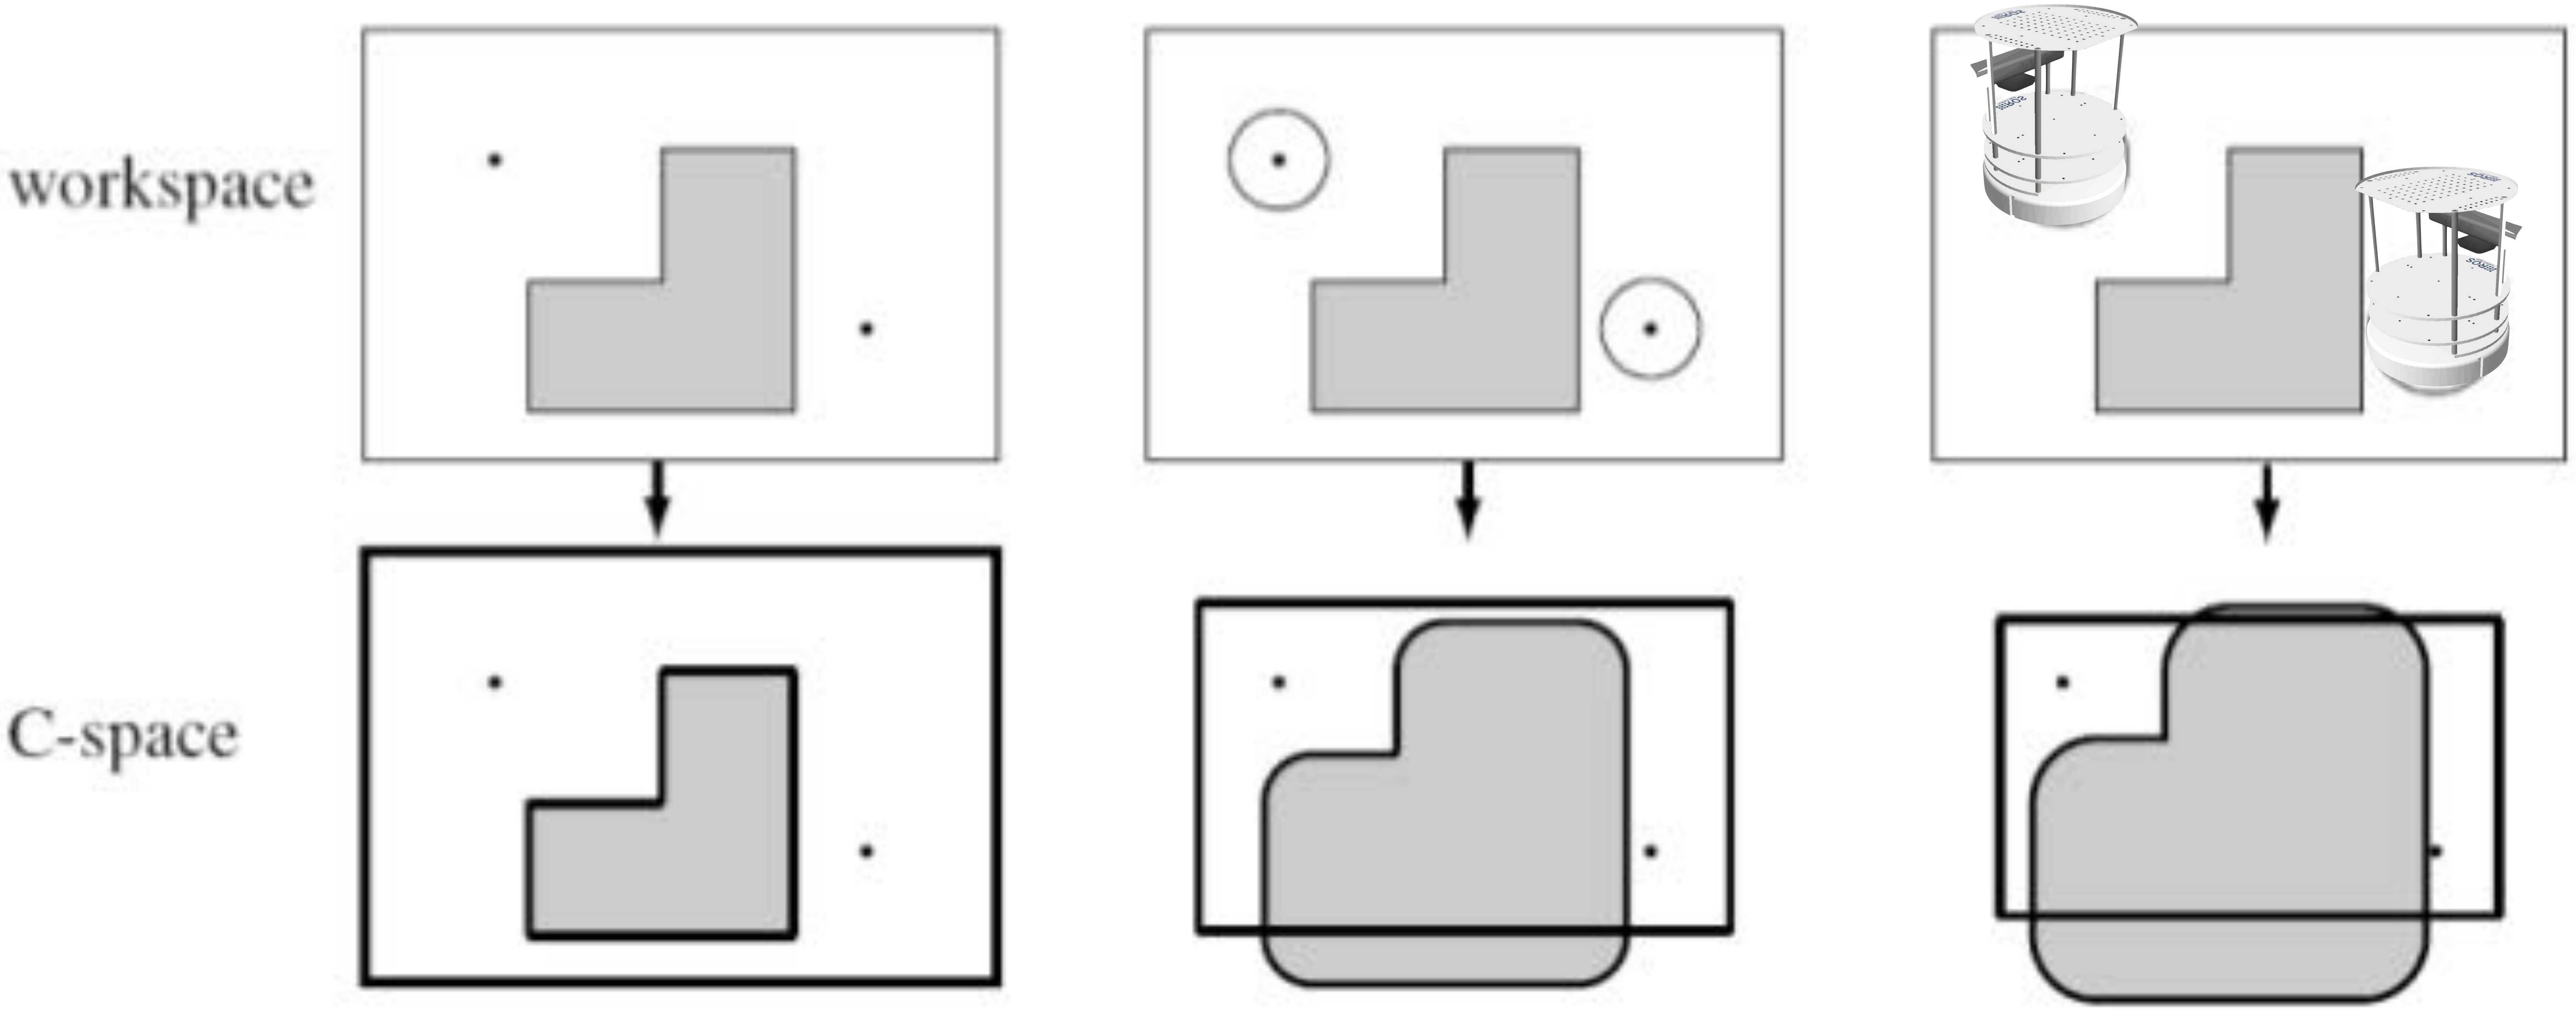
- Other than rotation, how is the Turtlebot different than the point robot?





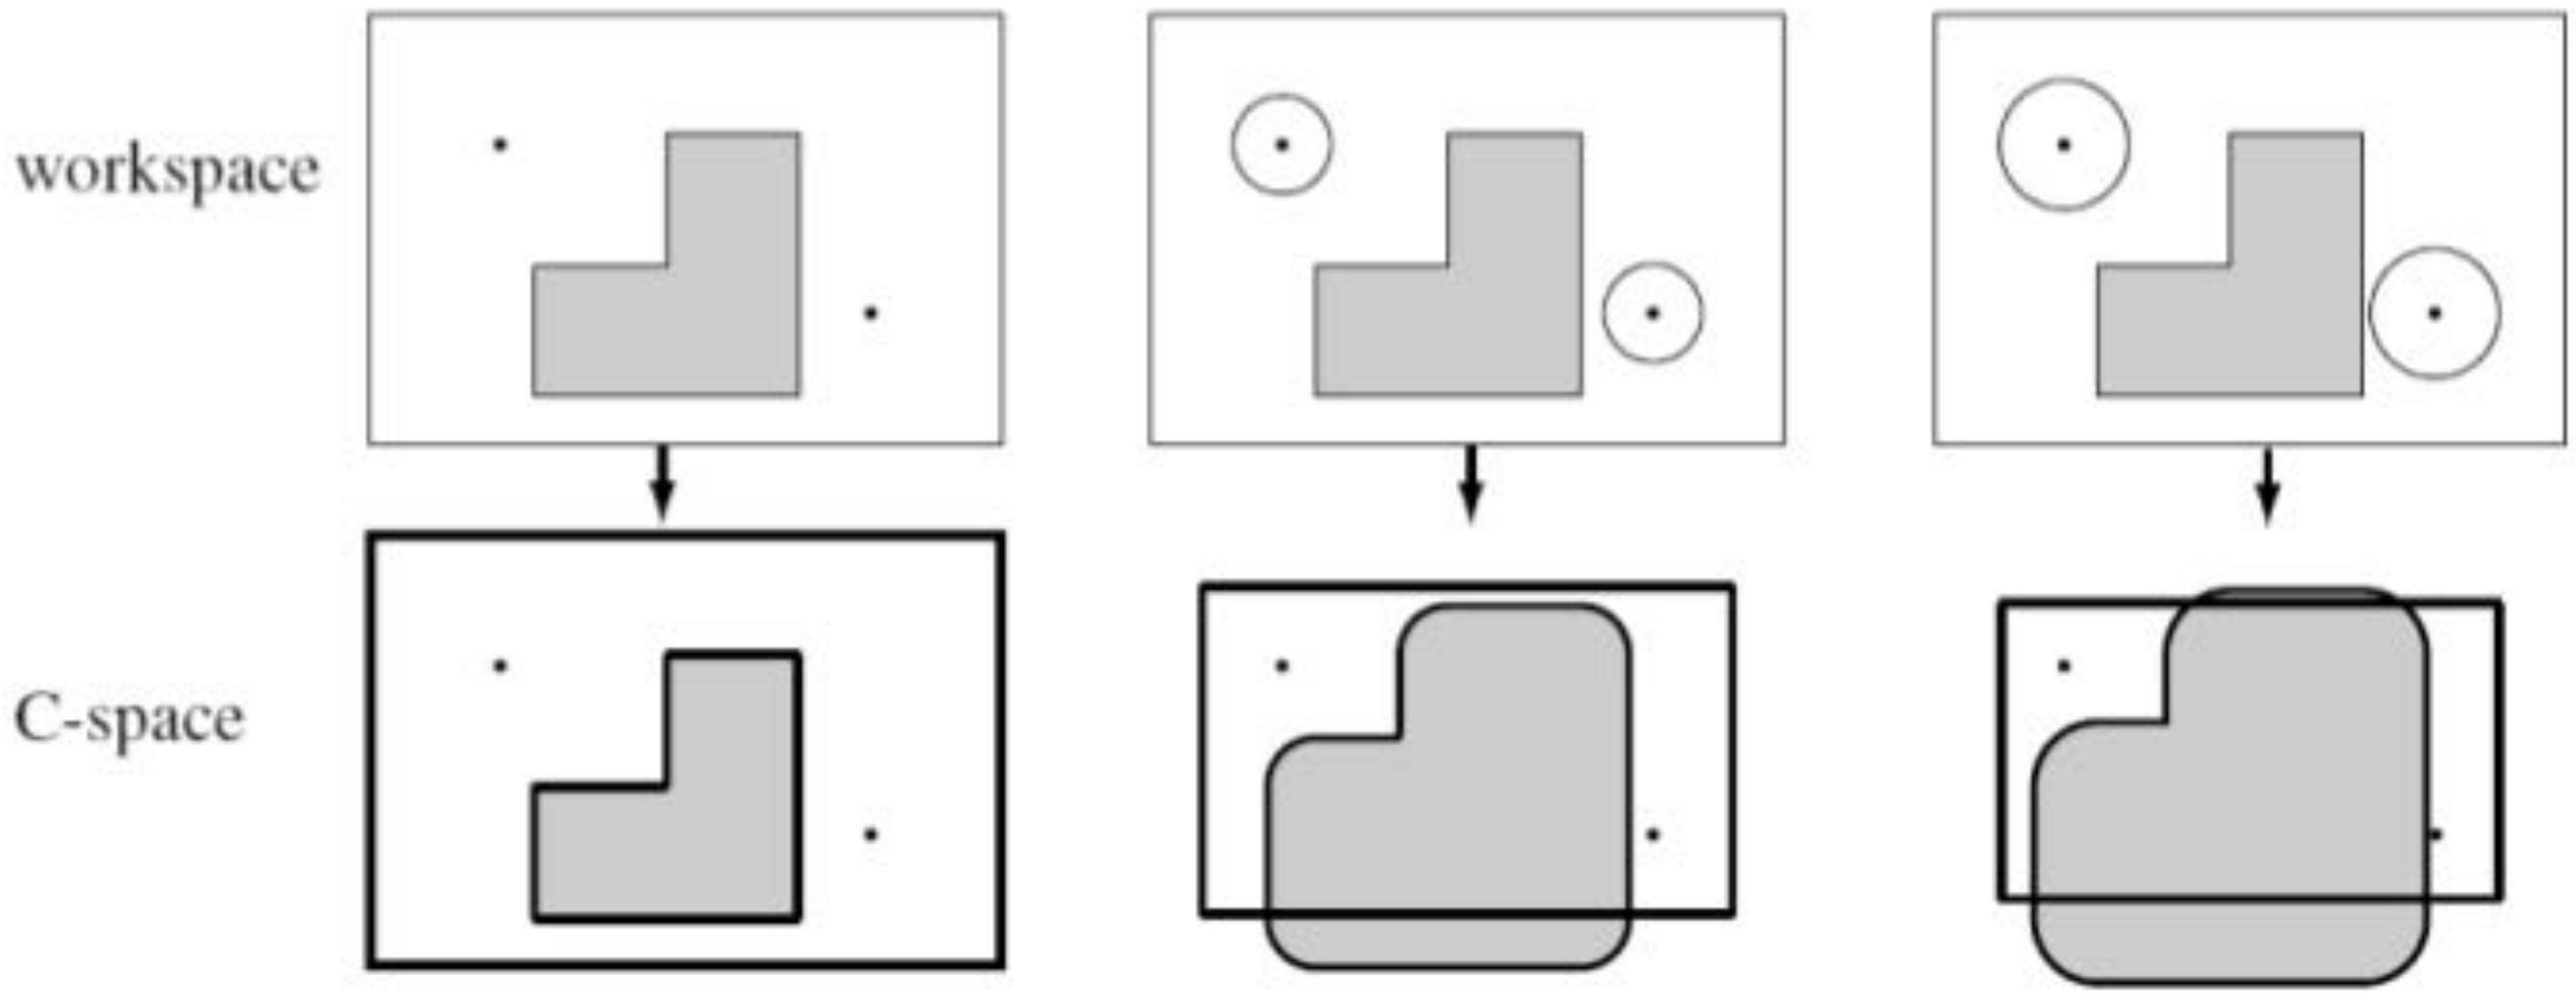
Robot Geometry

- Turtlebot is larger than a point, having a circular radius in the robot's planar workspace
- As this radius increases, the C-space shrinks

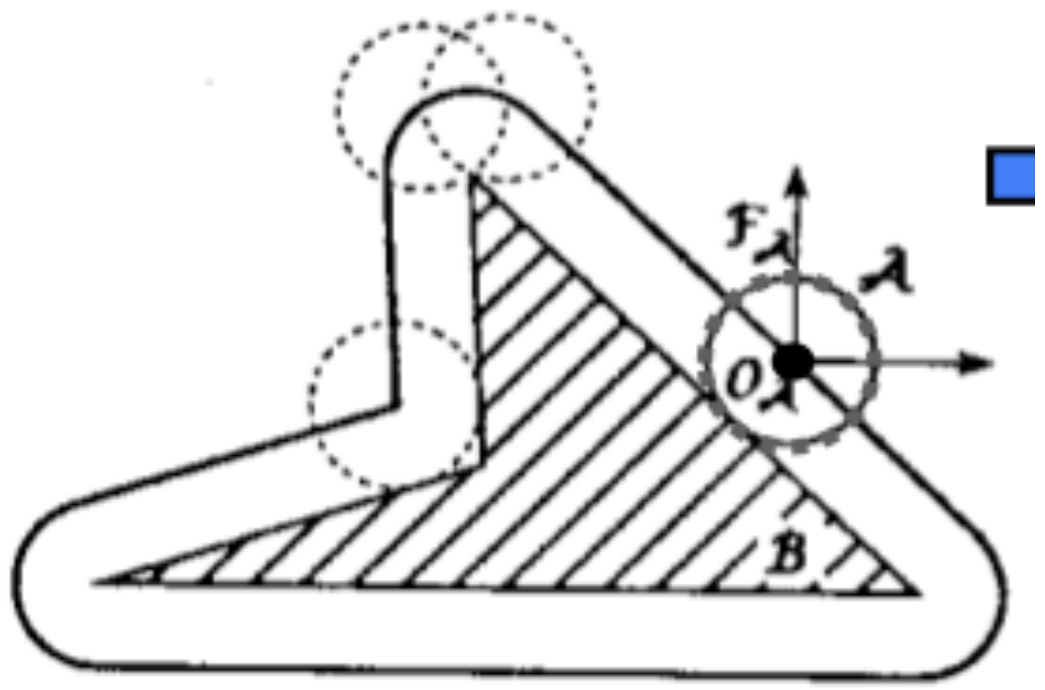


Robot Geometry

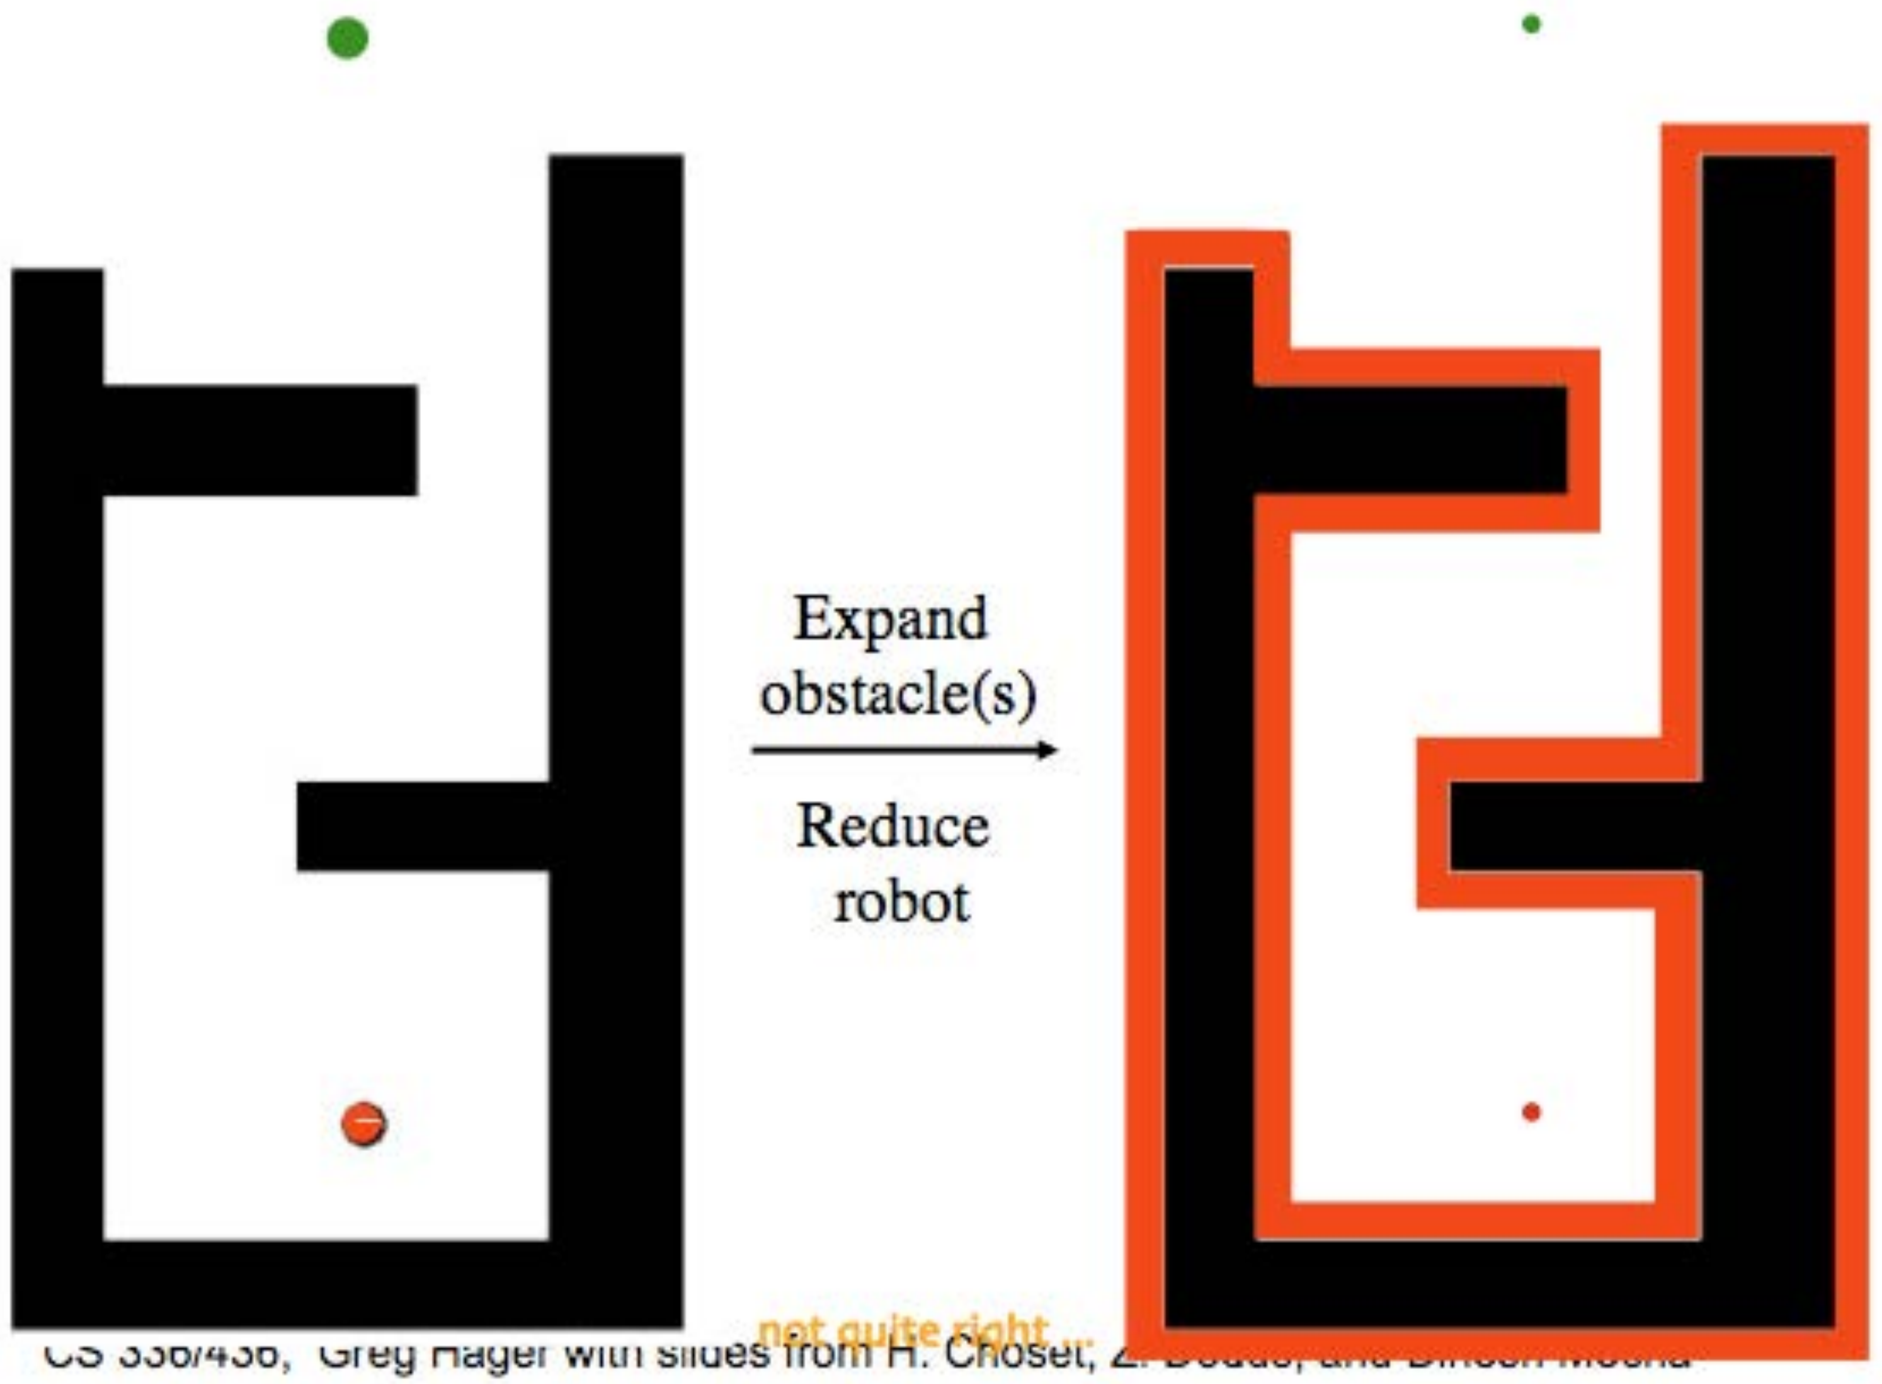
- Turtlebot is larger than a point, having a circular radius in the robot's planar workspace
- As this radius increases, the C-space shrinks



Conversion to point robot C-space

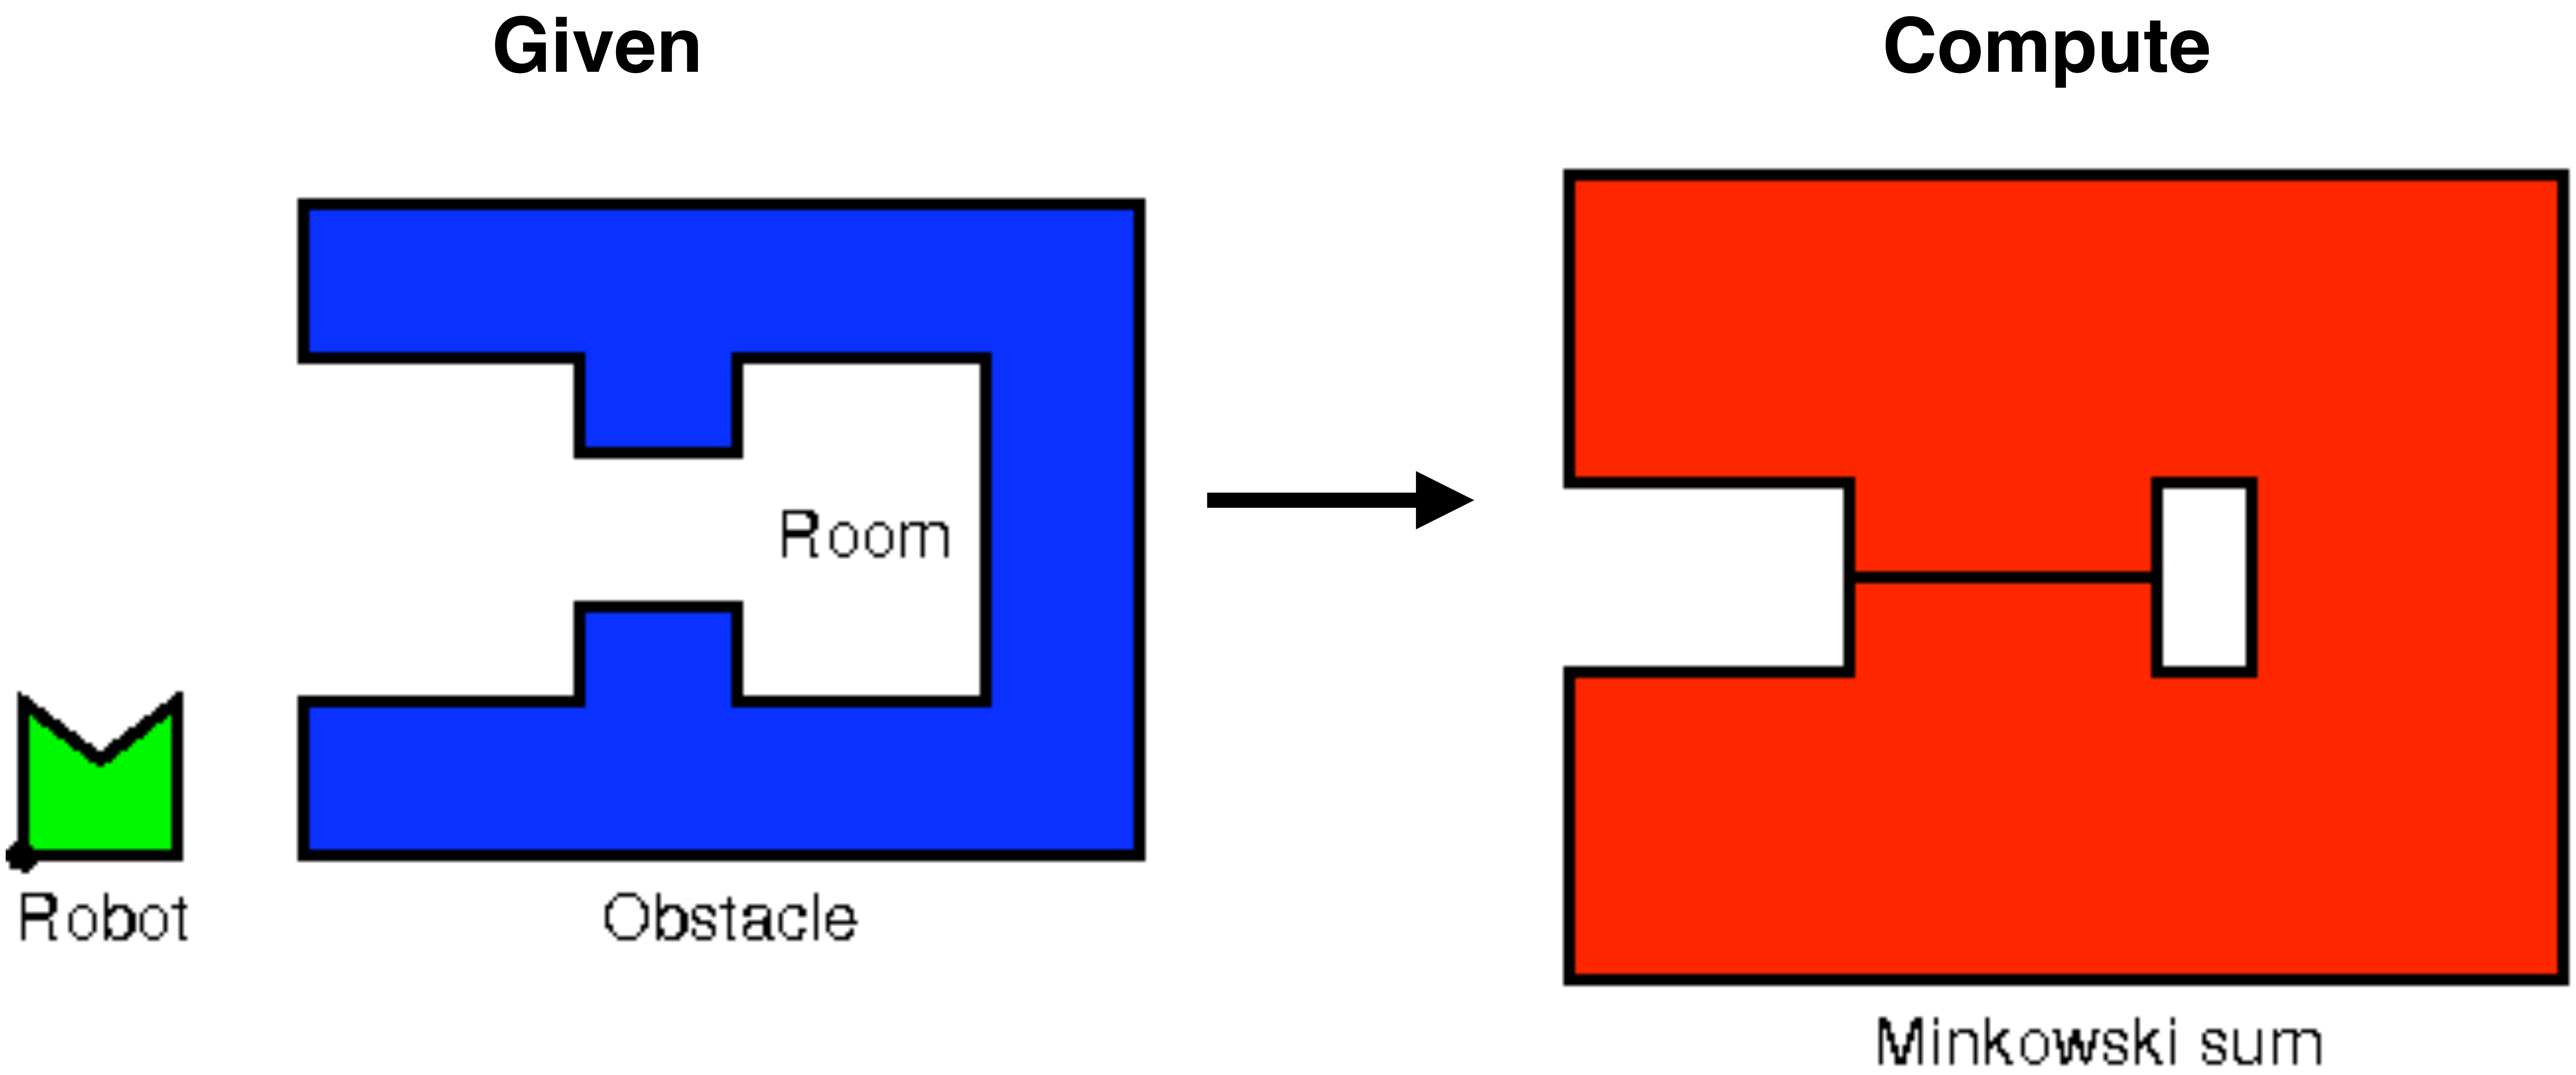


- Workspace for robot can be converted to point robot C-space
- Expand obstacles by tracing robot geometry along boundary
- Computable by Minkowski sum



Slide borrowed from Michigan Robotics autorob.org

Minkowski Planning



Minkowski Planning

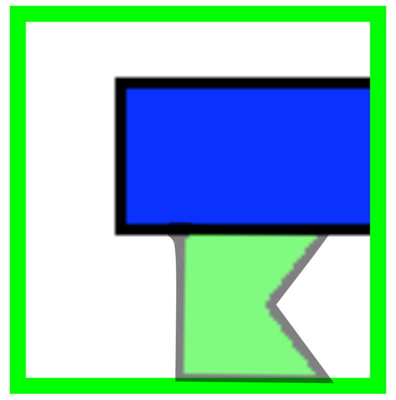
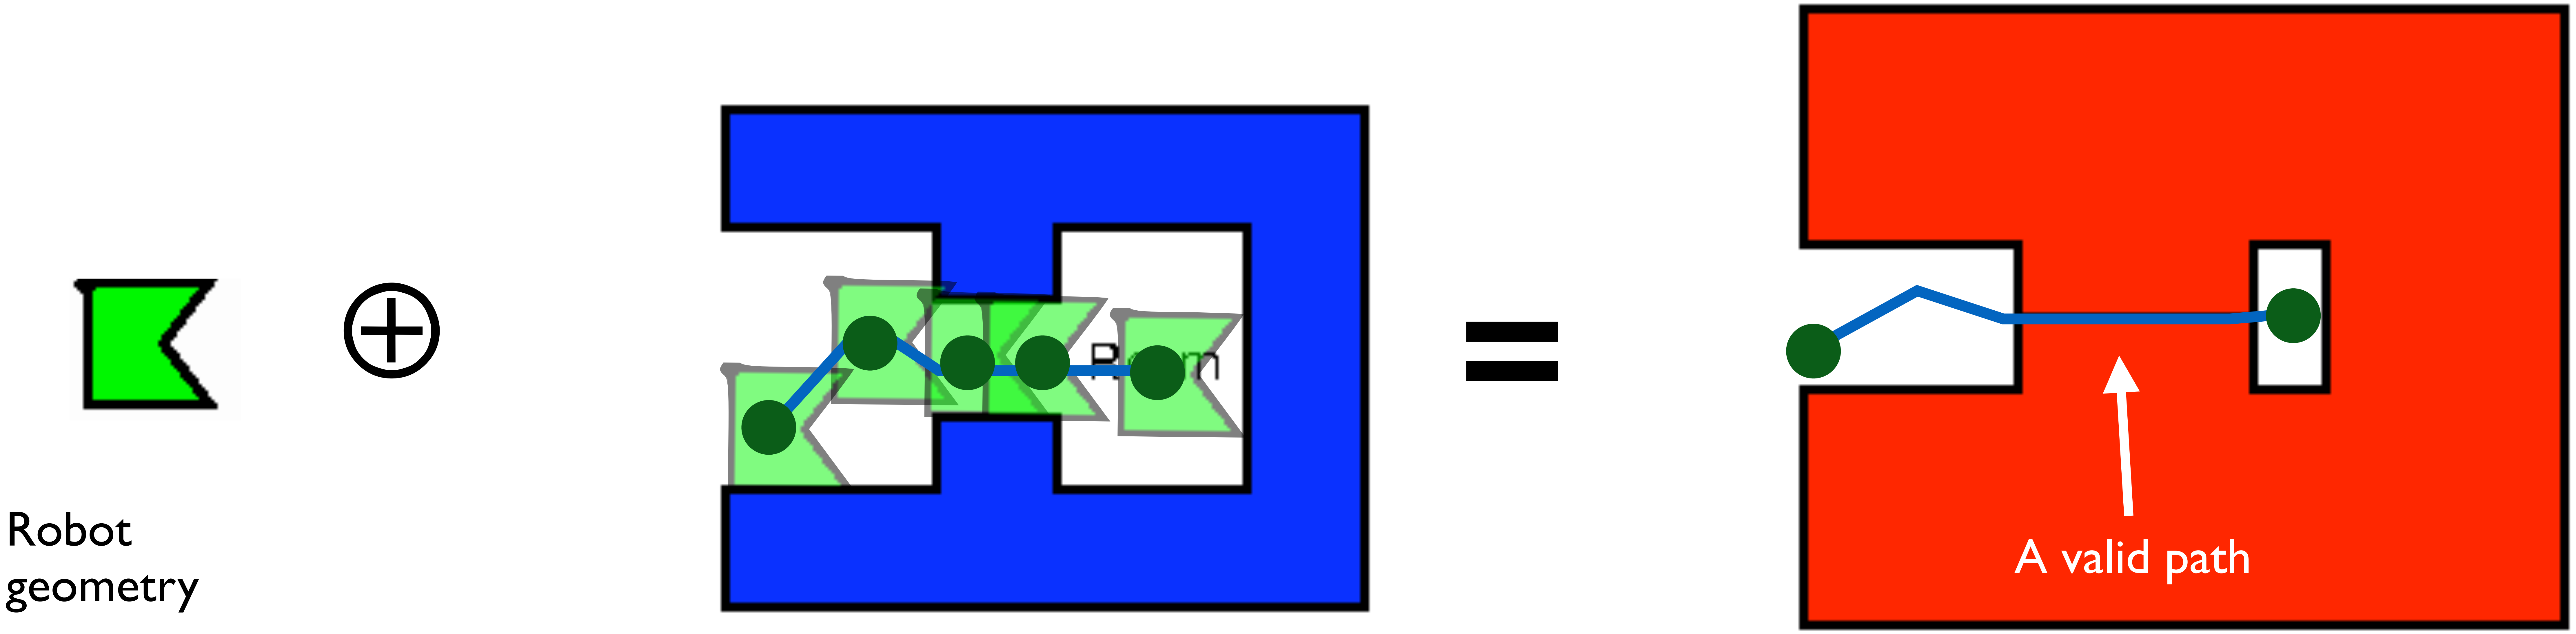
Occlude location if robot intersects obstacle



Leave location free if robot non-intersecting with object

Minkowski sum: identify non intersecting robot locations

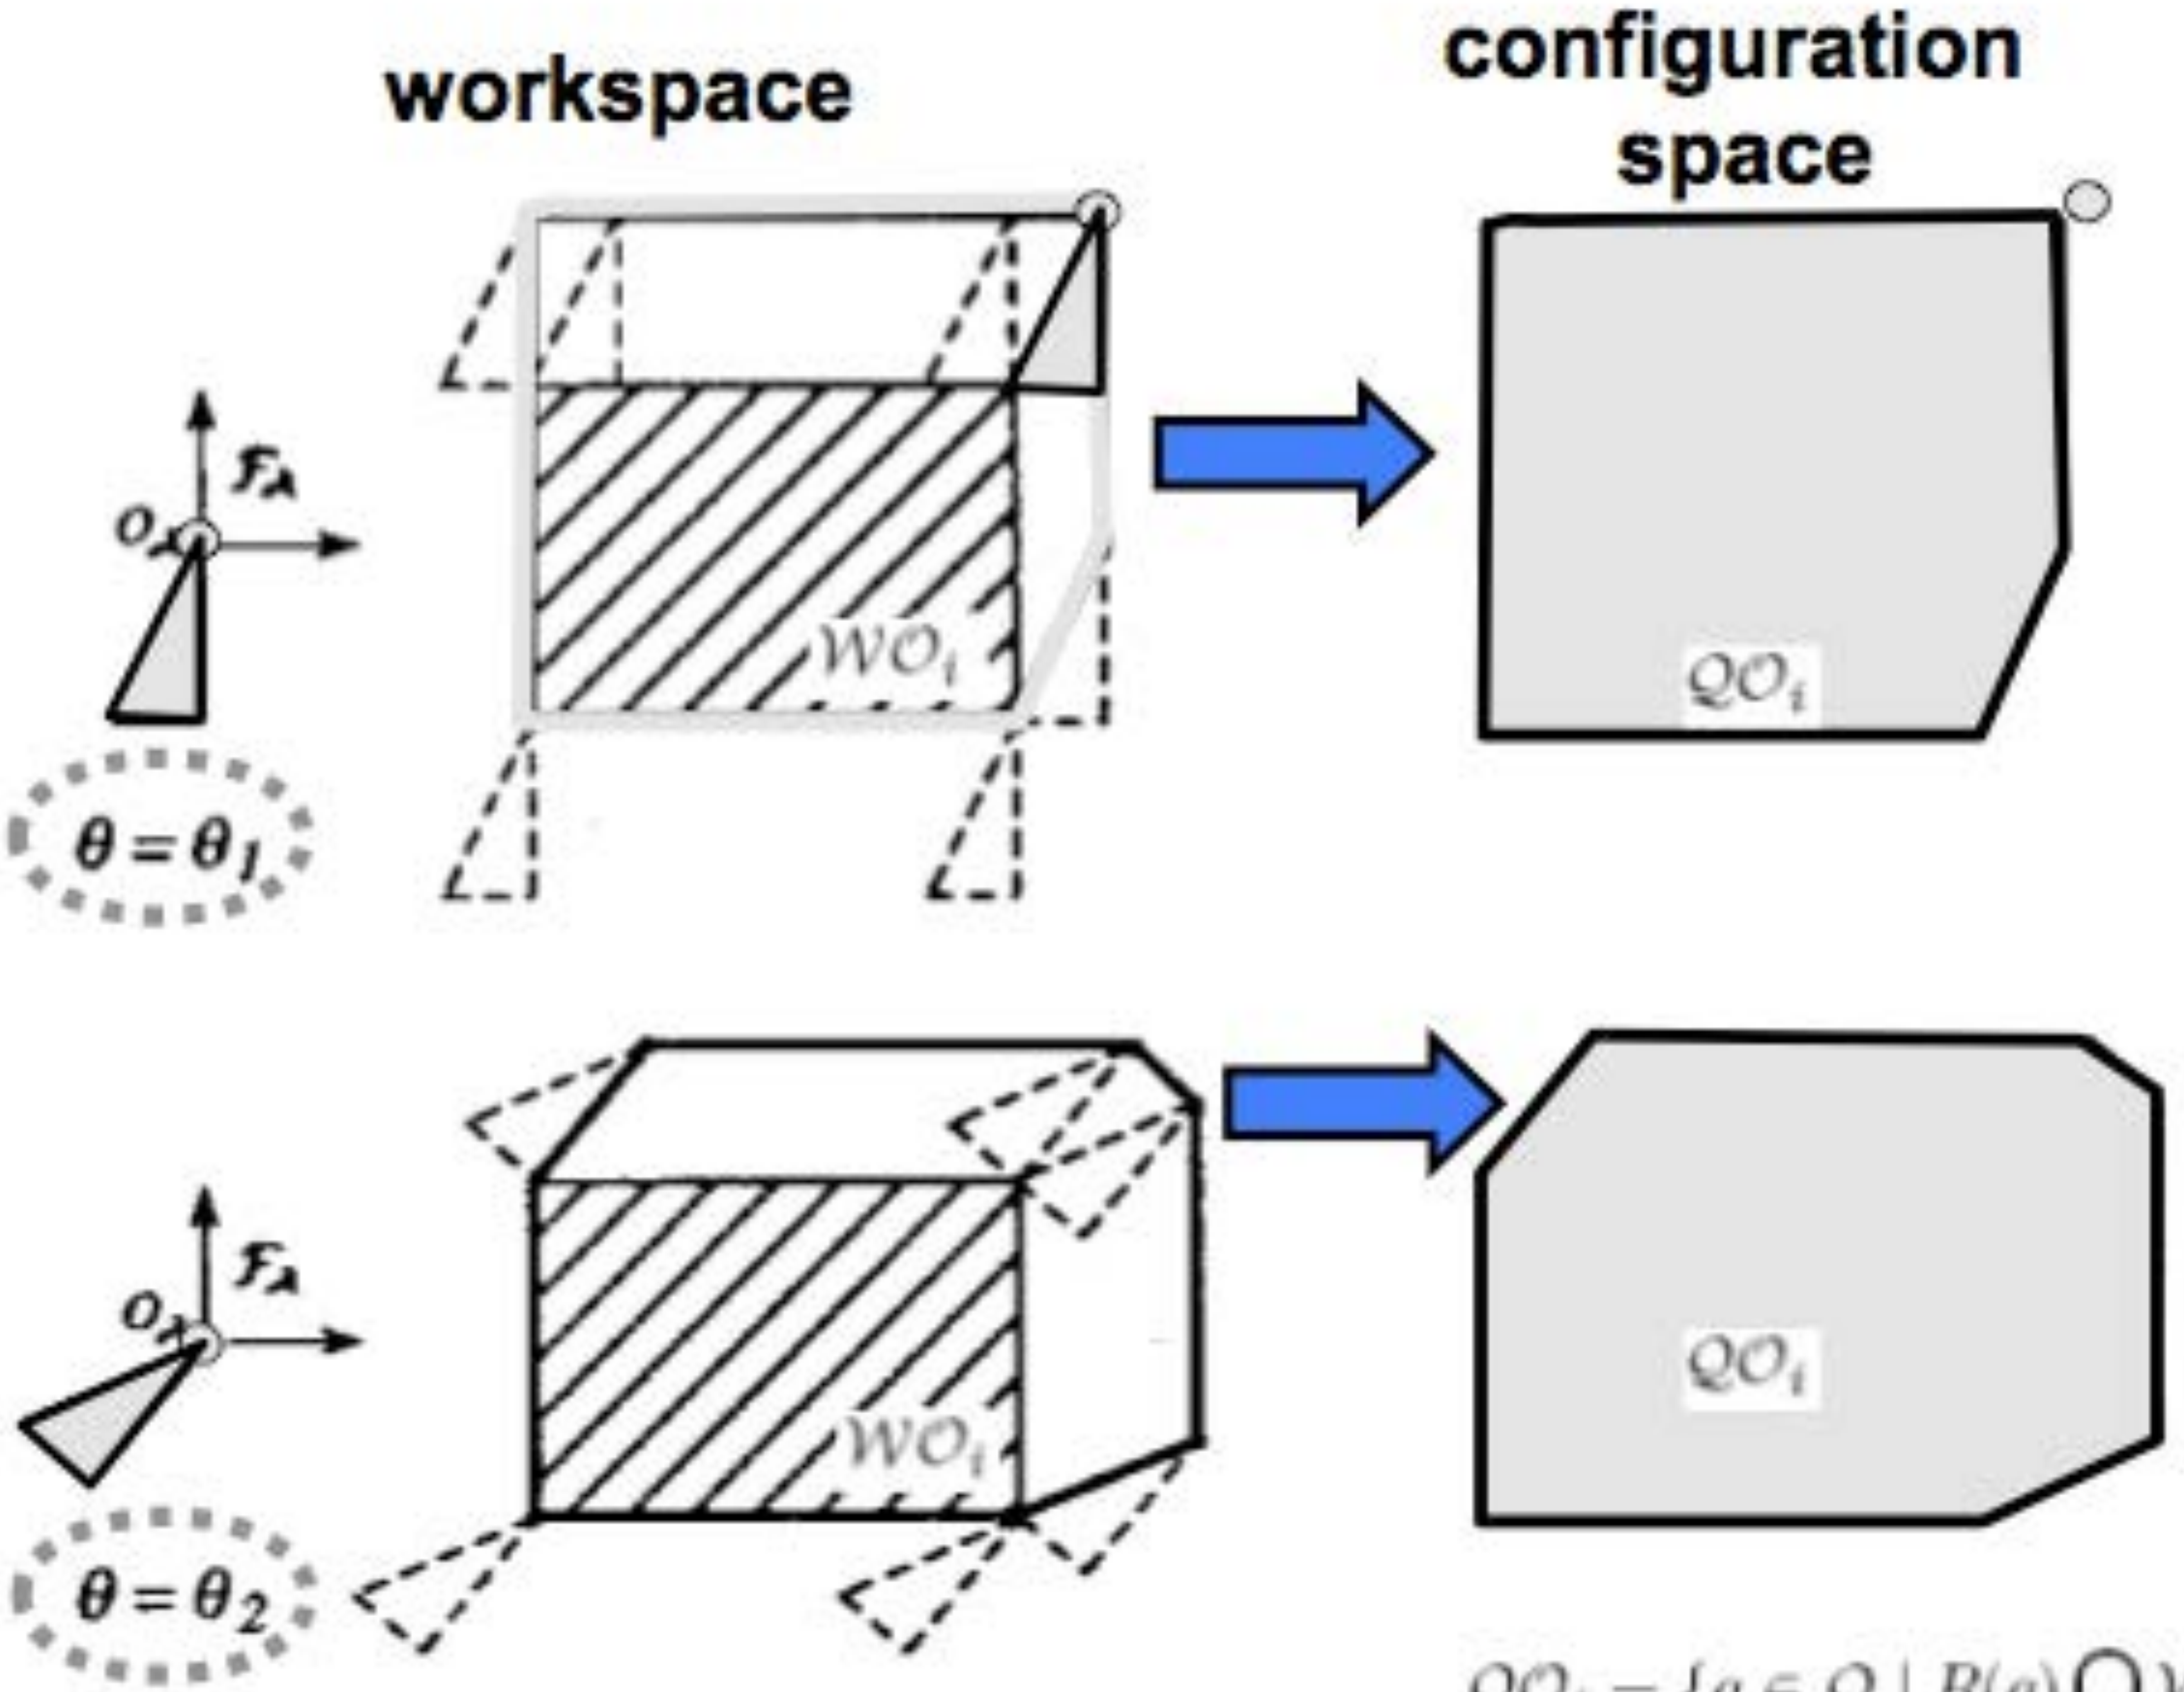


Space of valid paths defined by Minkowski sum

Slide borrowed from Michigan Robotics autorob.org

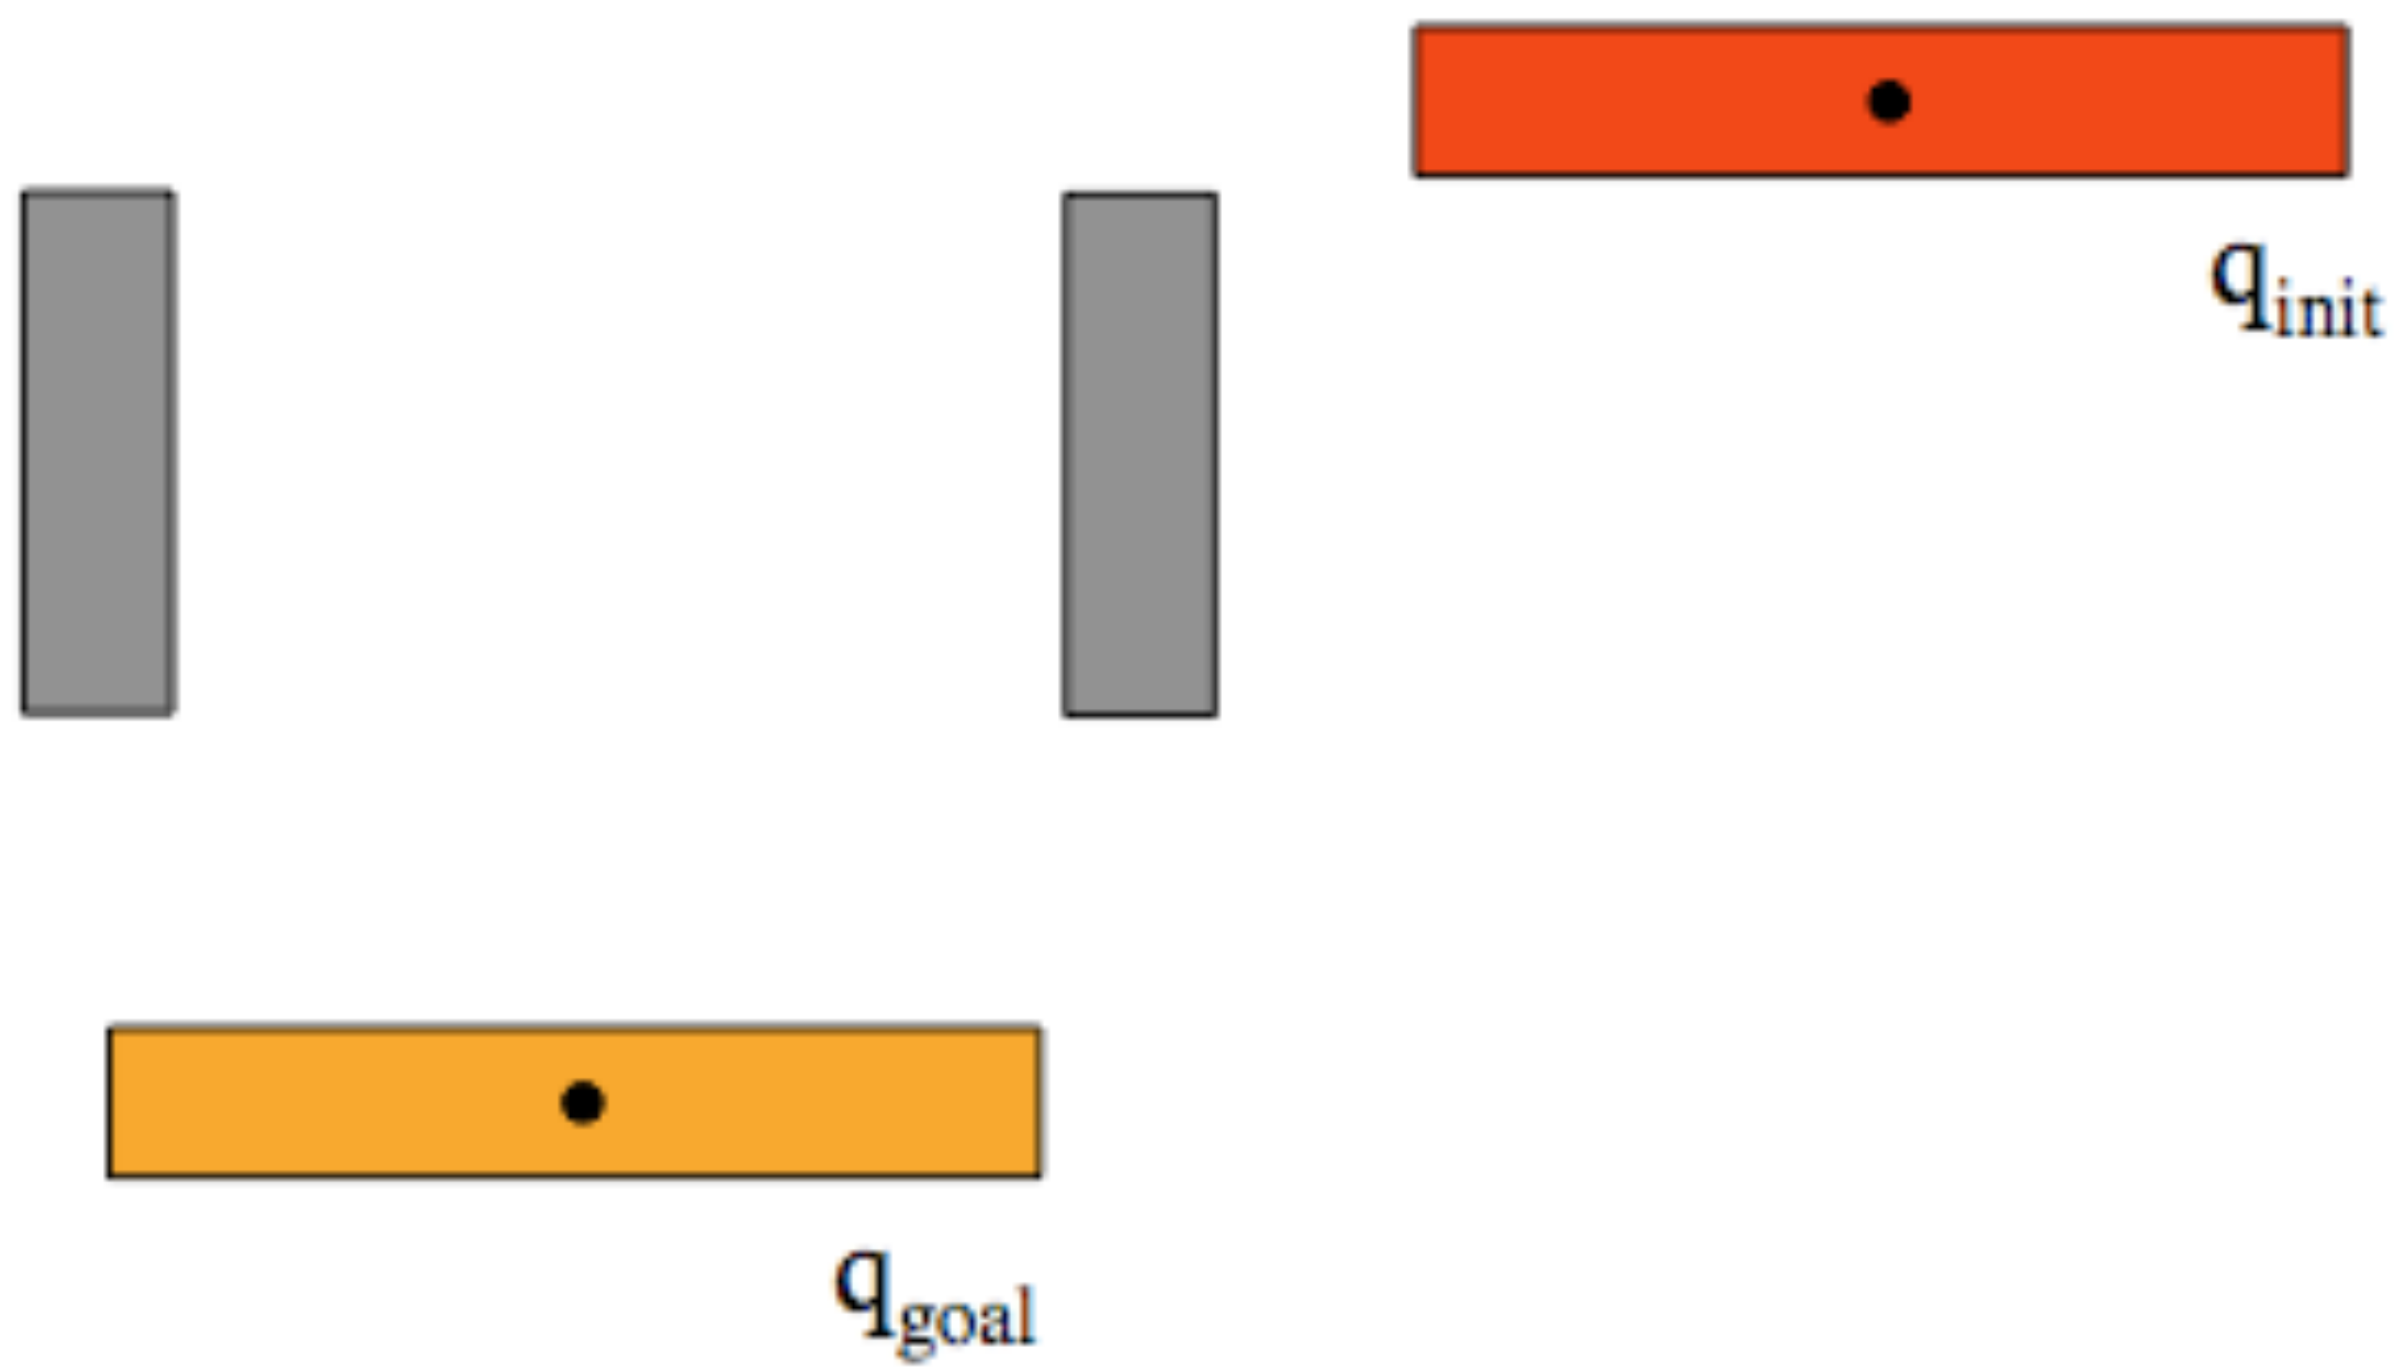
What does an obstacle look like in configuration space?

C-space depends on rotation

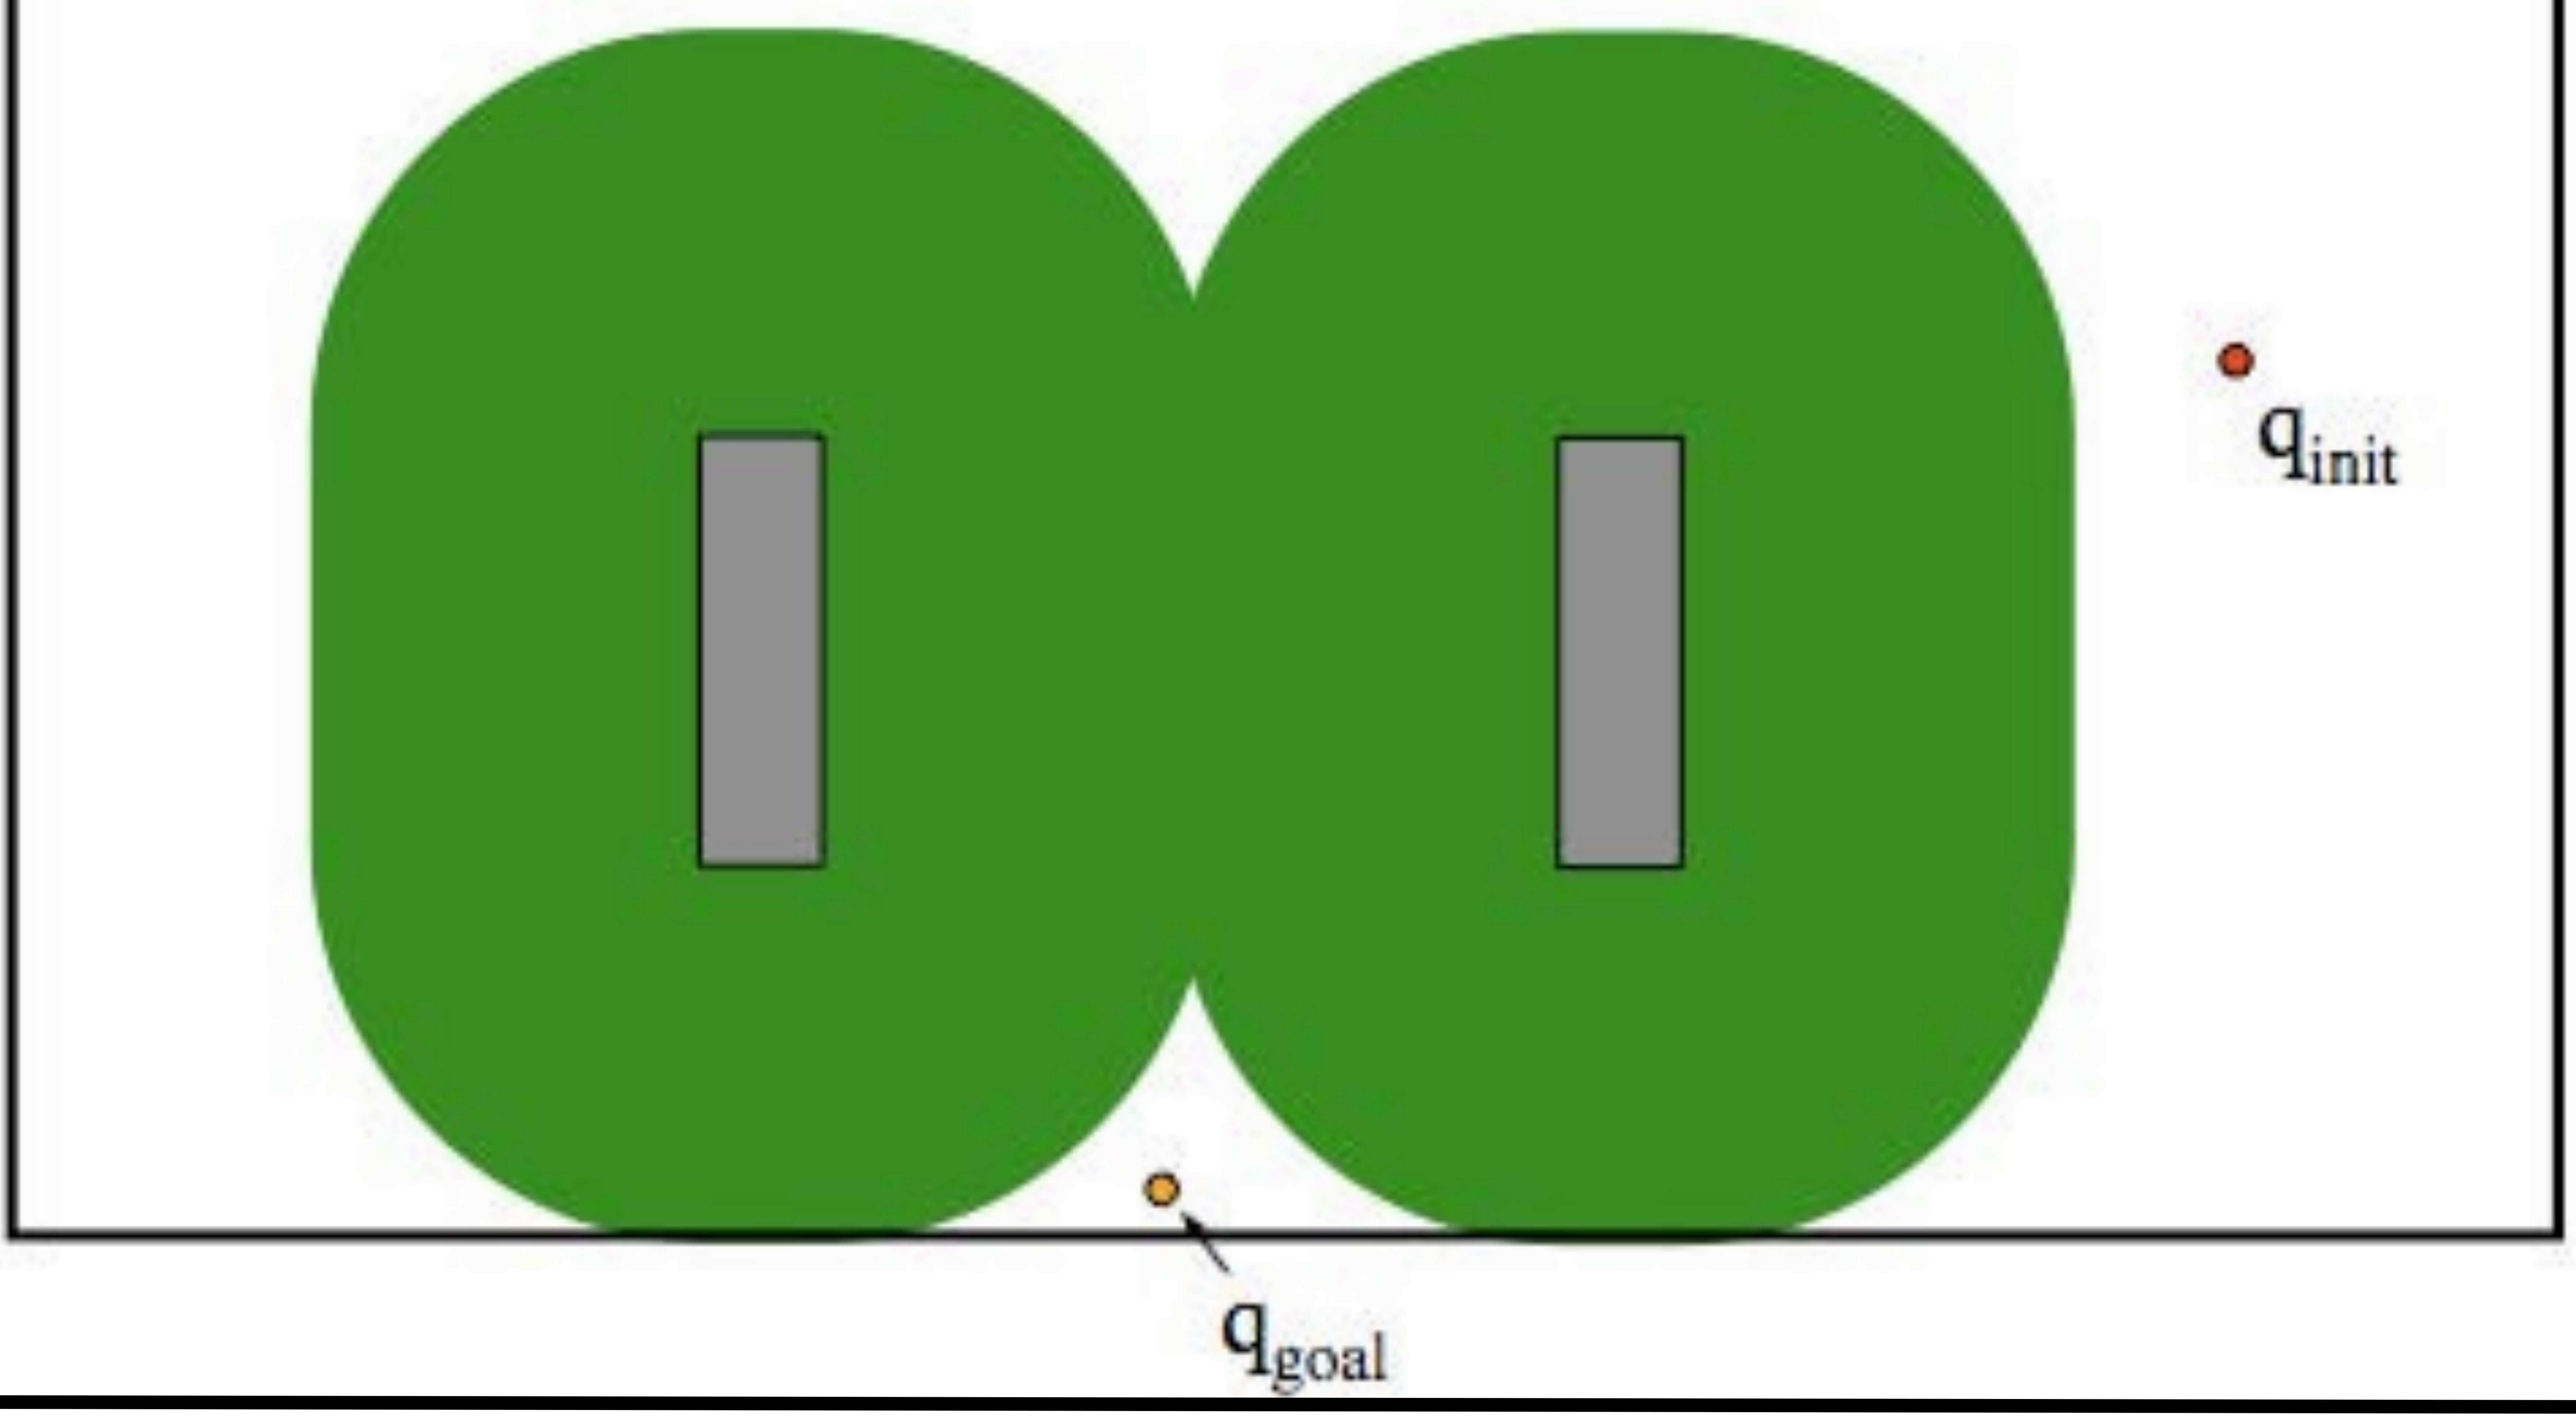


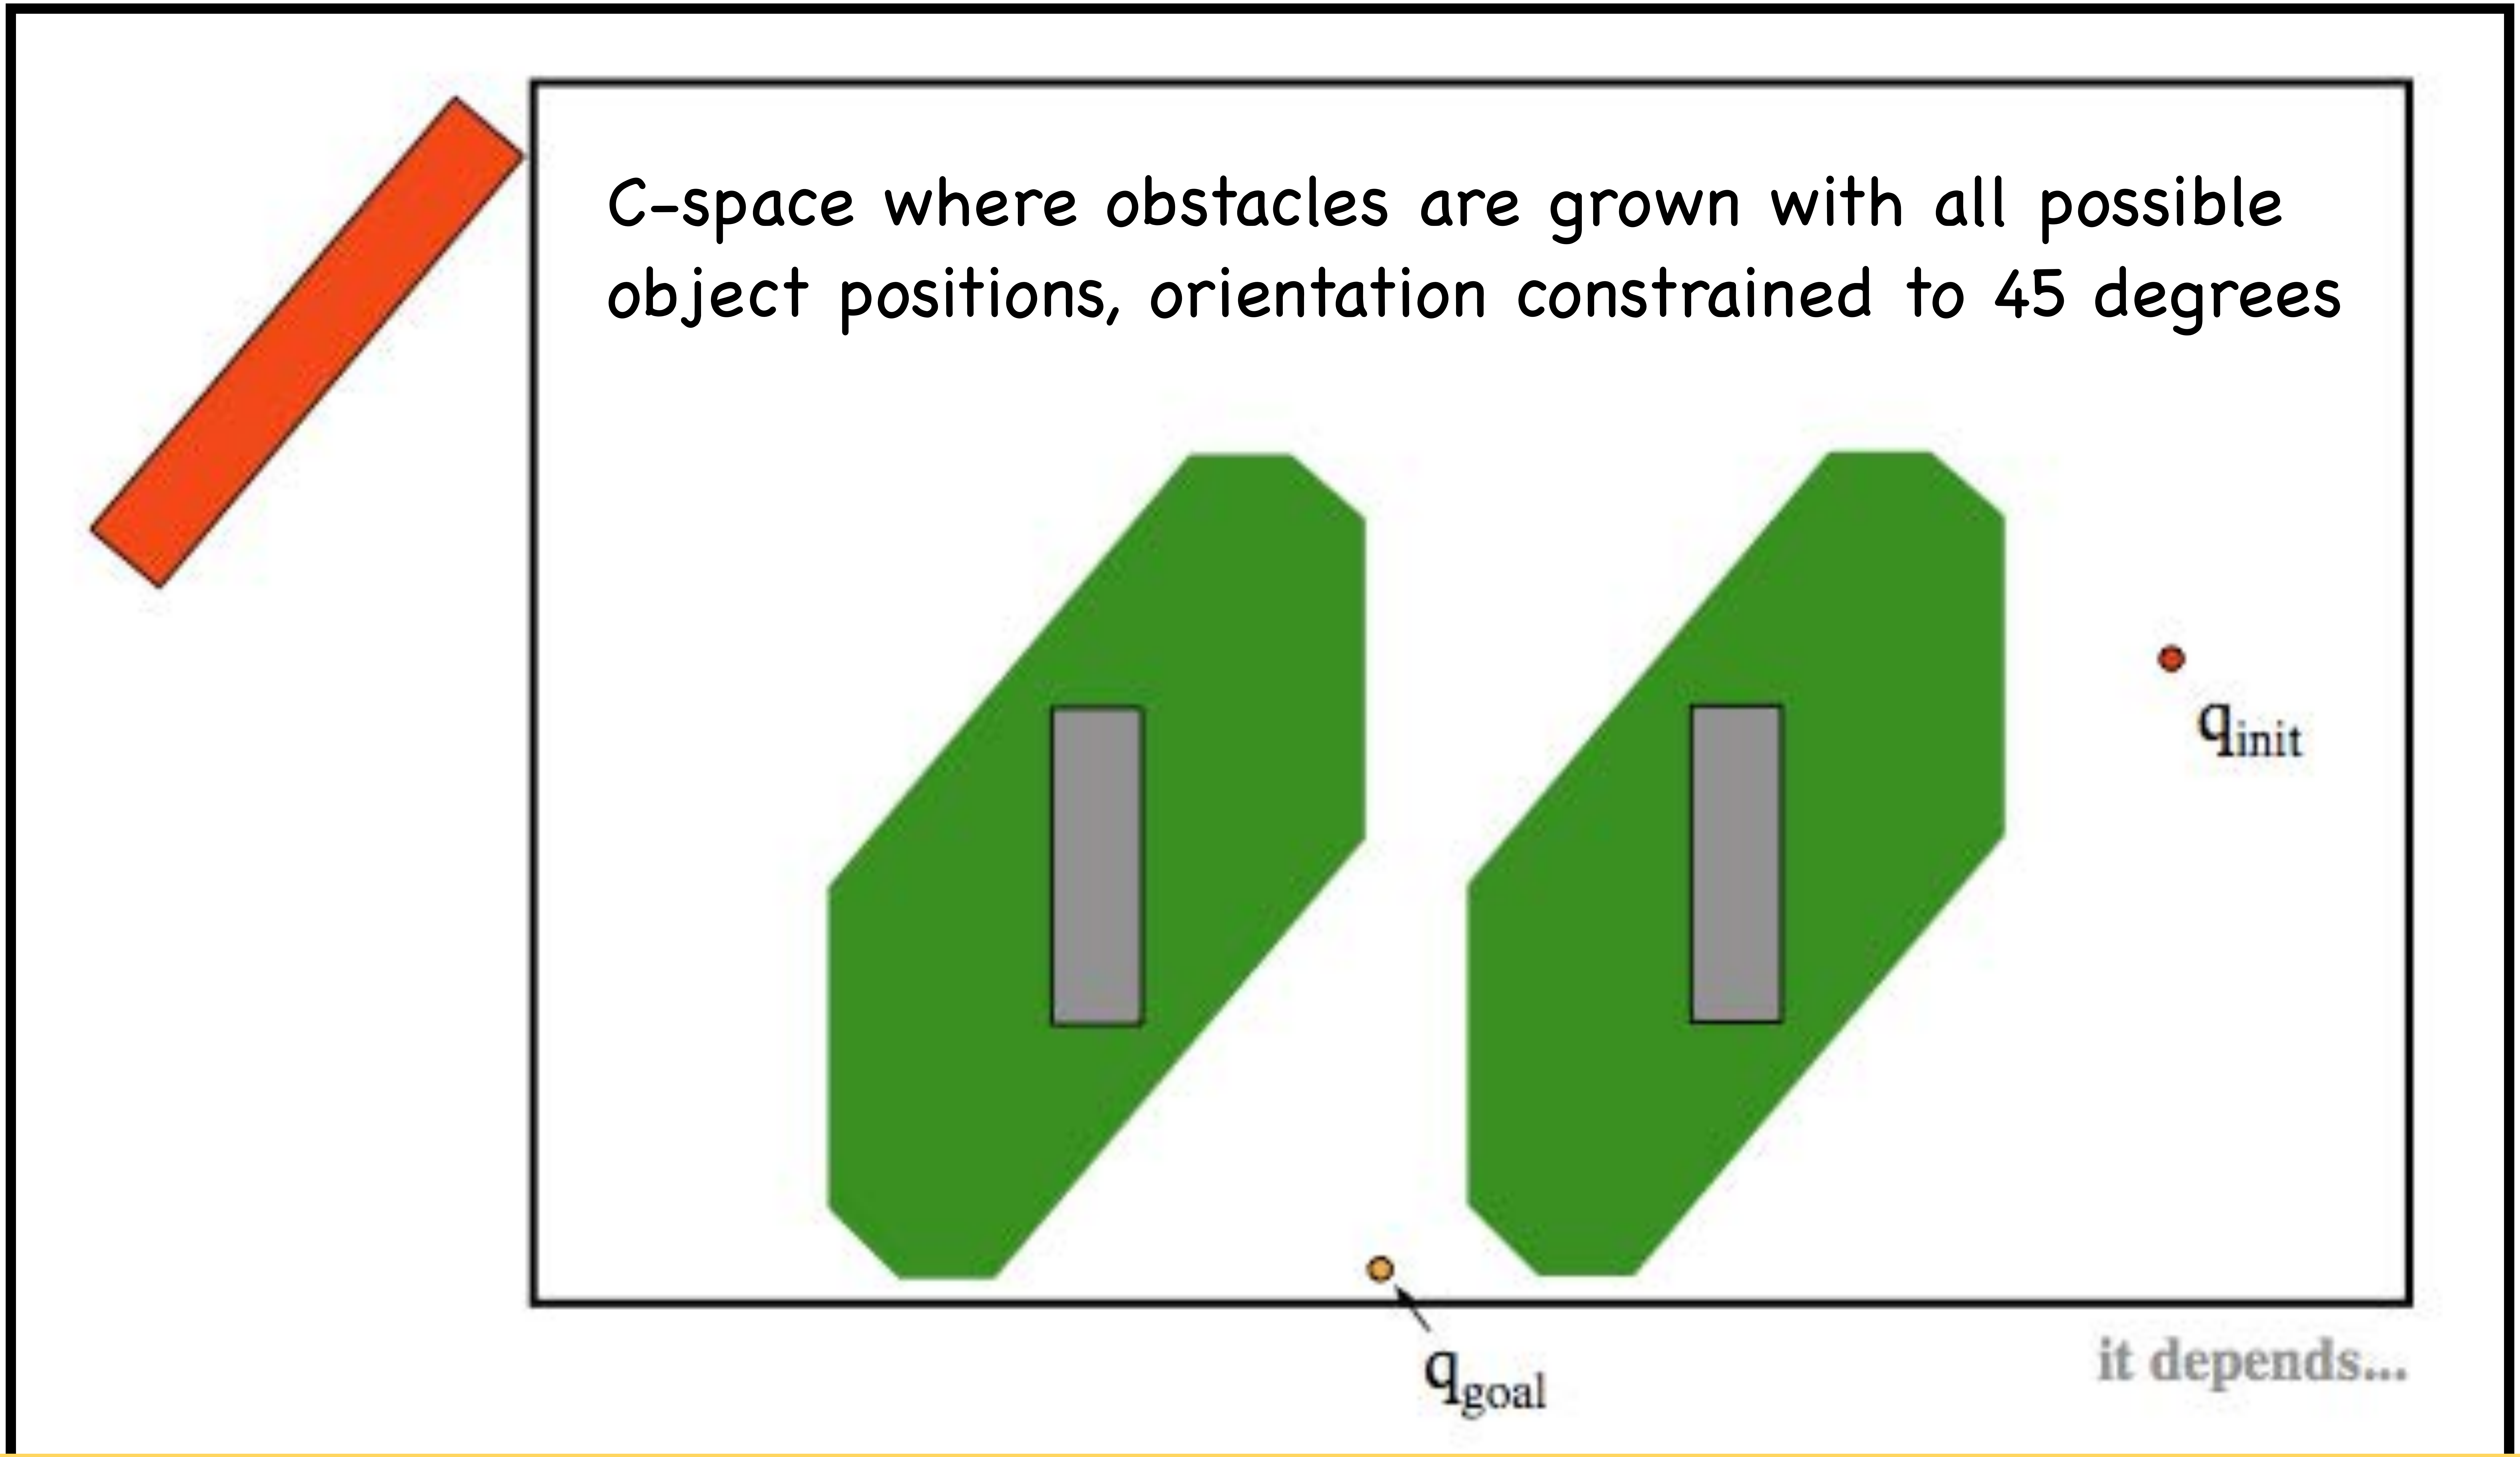
$QO_i = \{q \in Q \mid R(q) \bigcap WO_i \neq \emptyset\}.$

Consider this workspace...

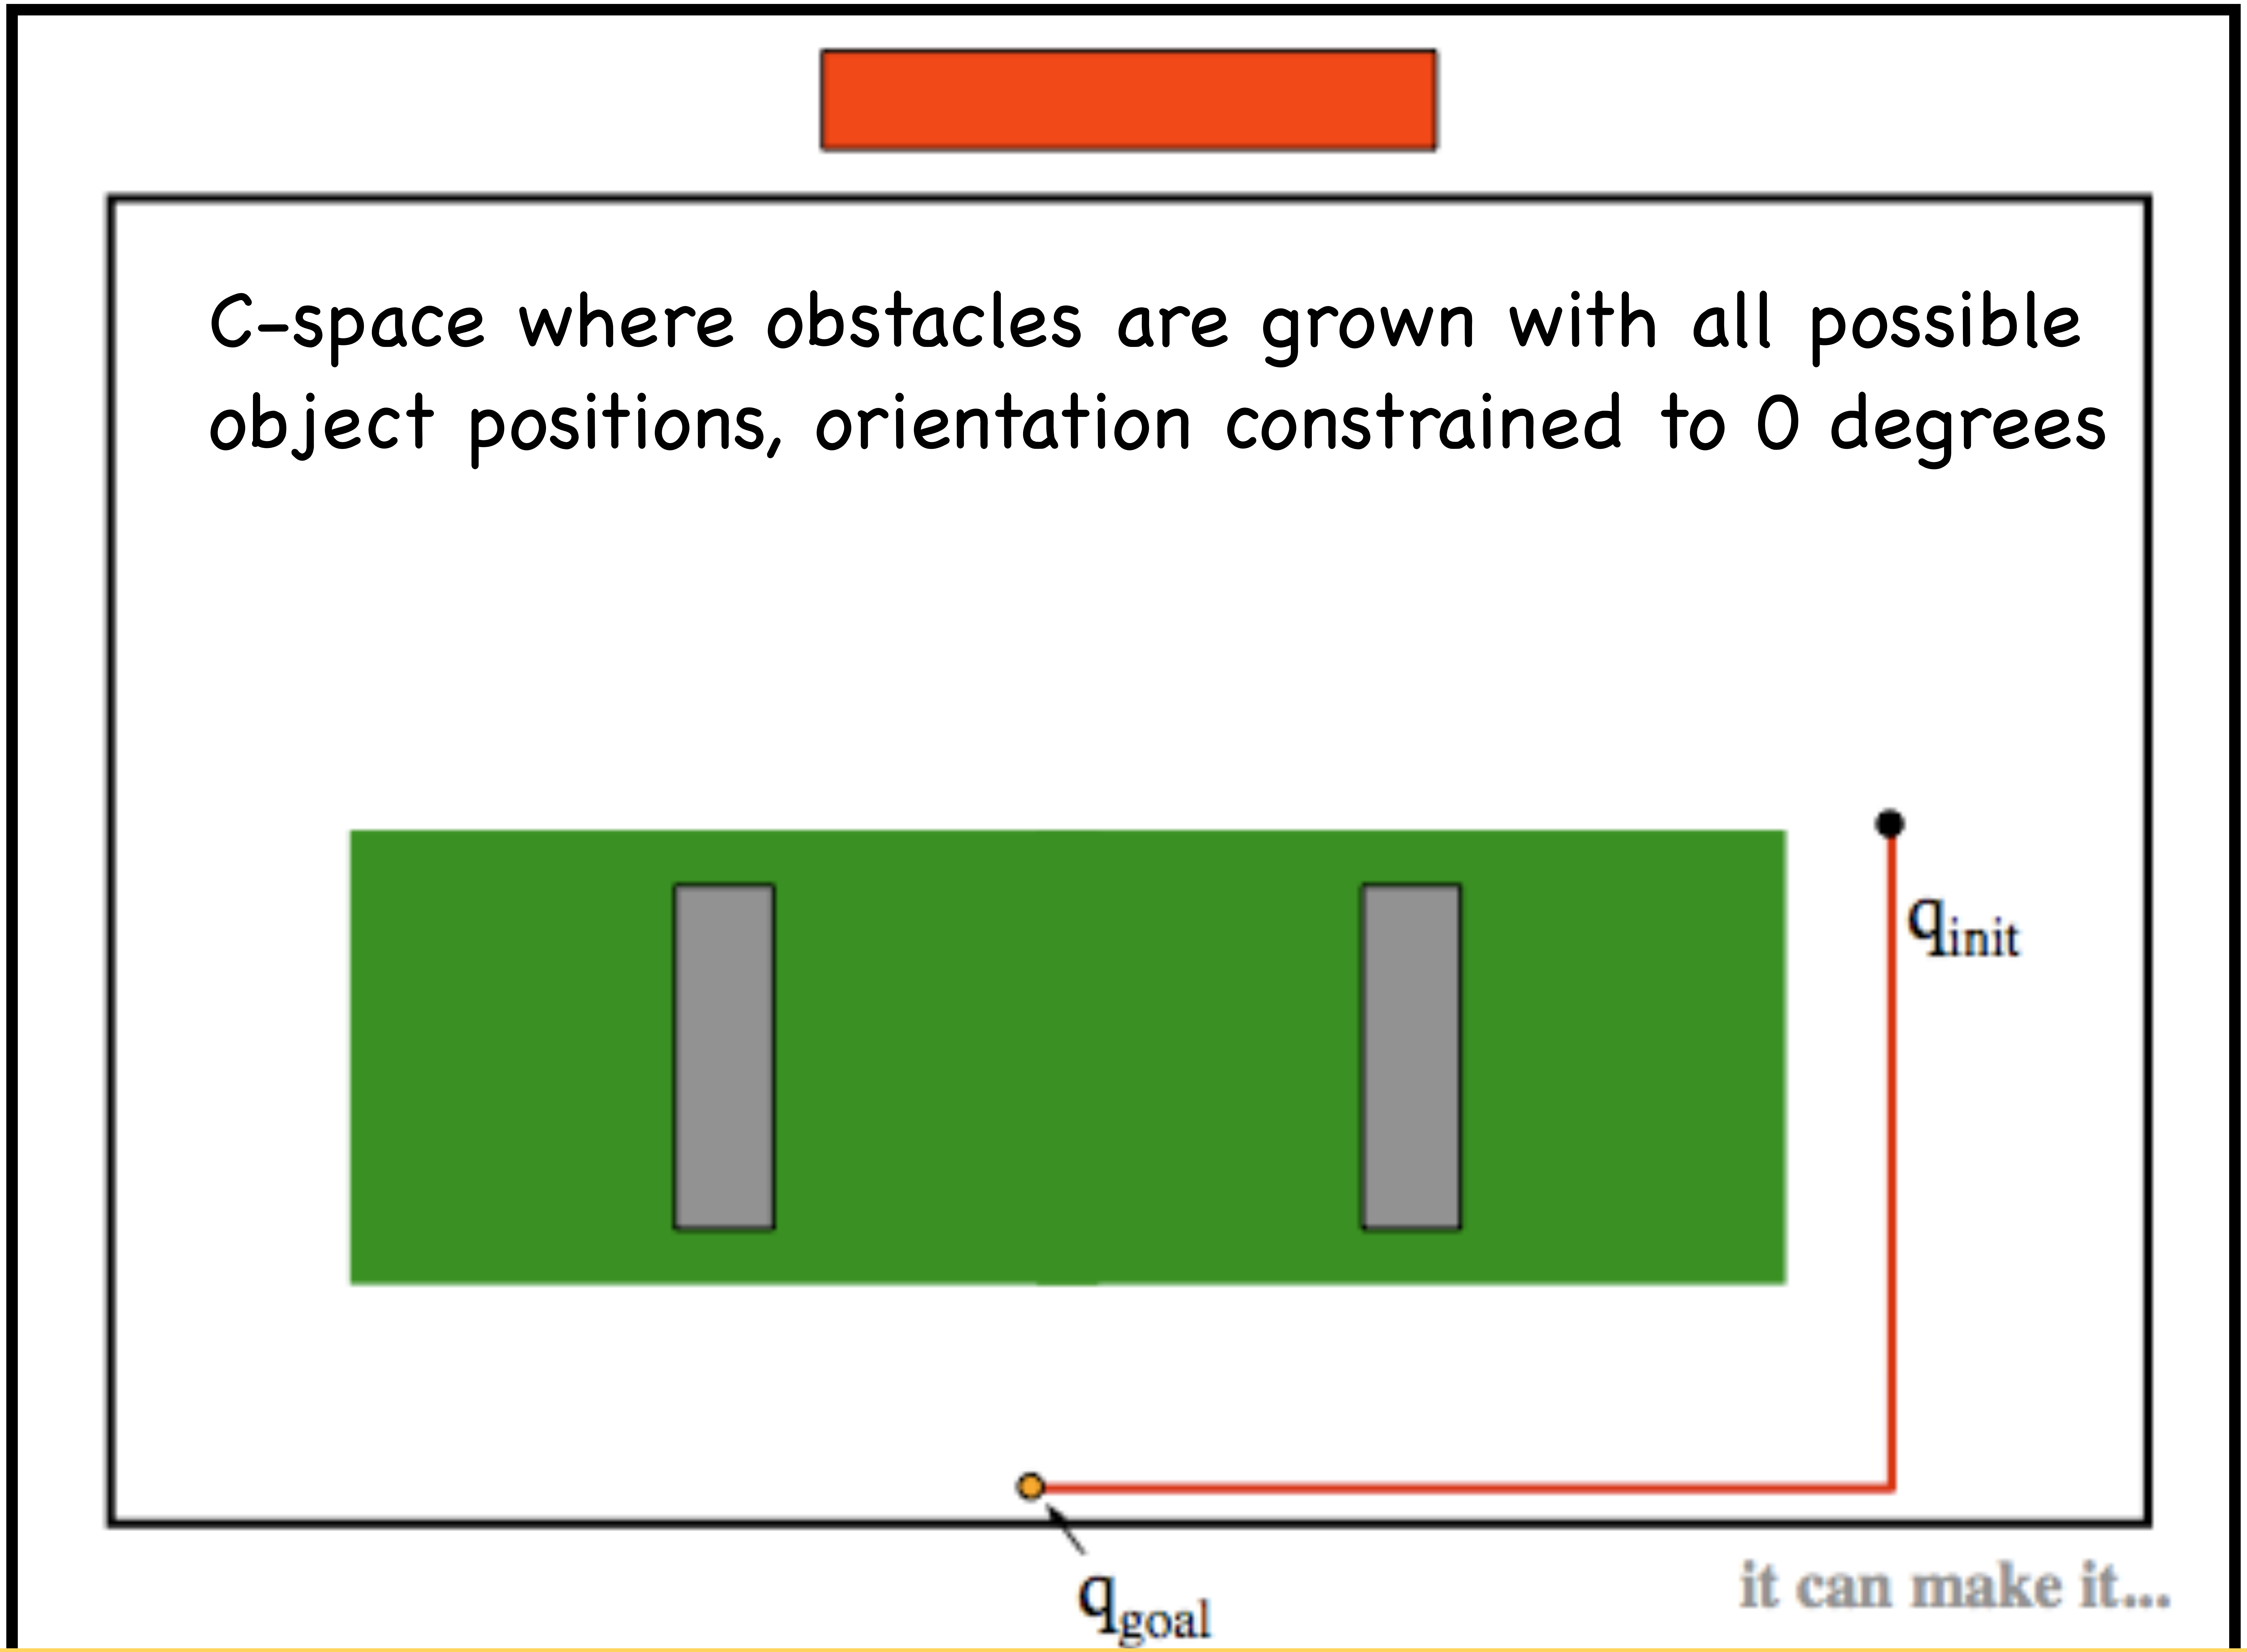


C-space where obstacles are grown with all possible object positions and orientations

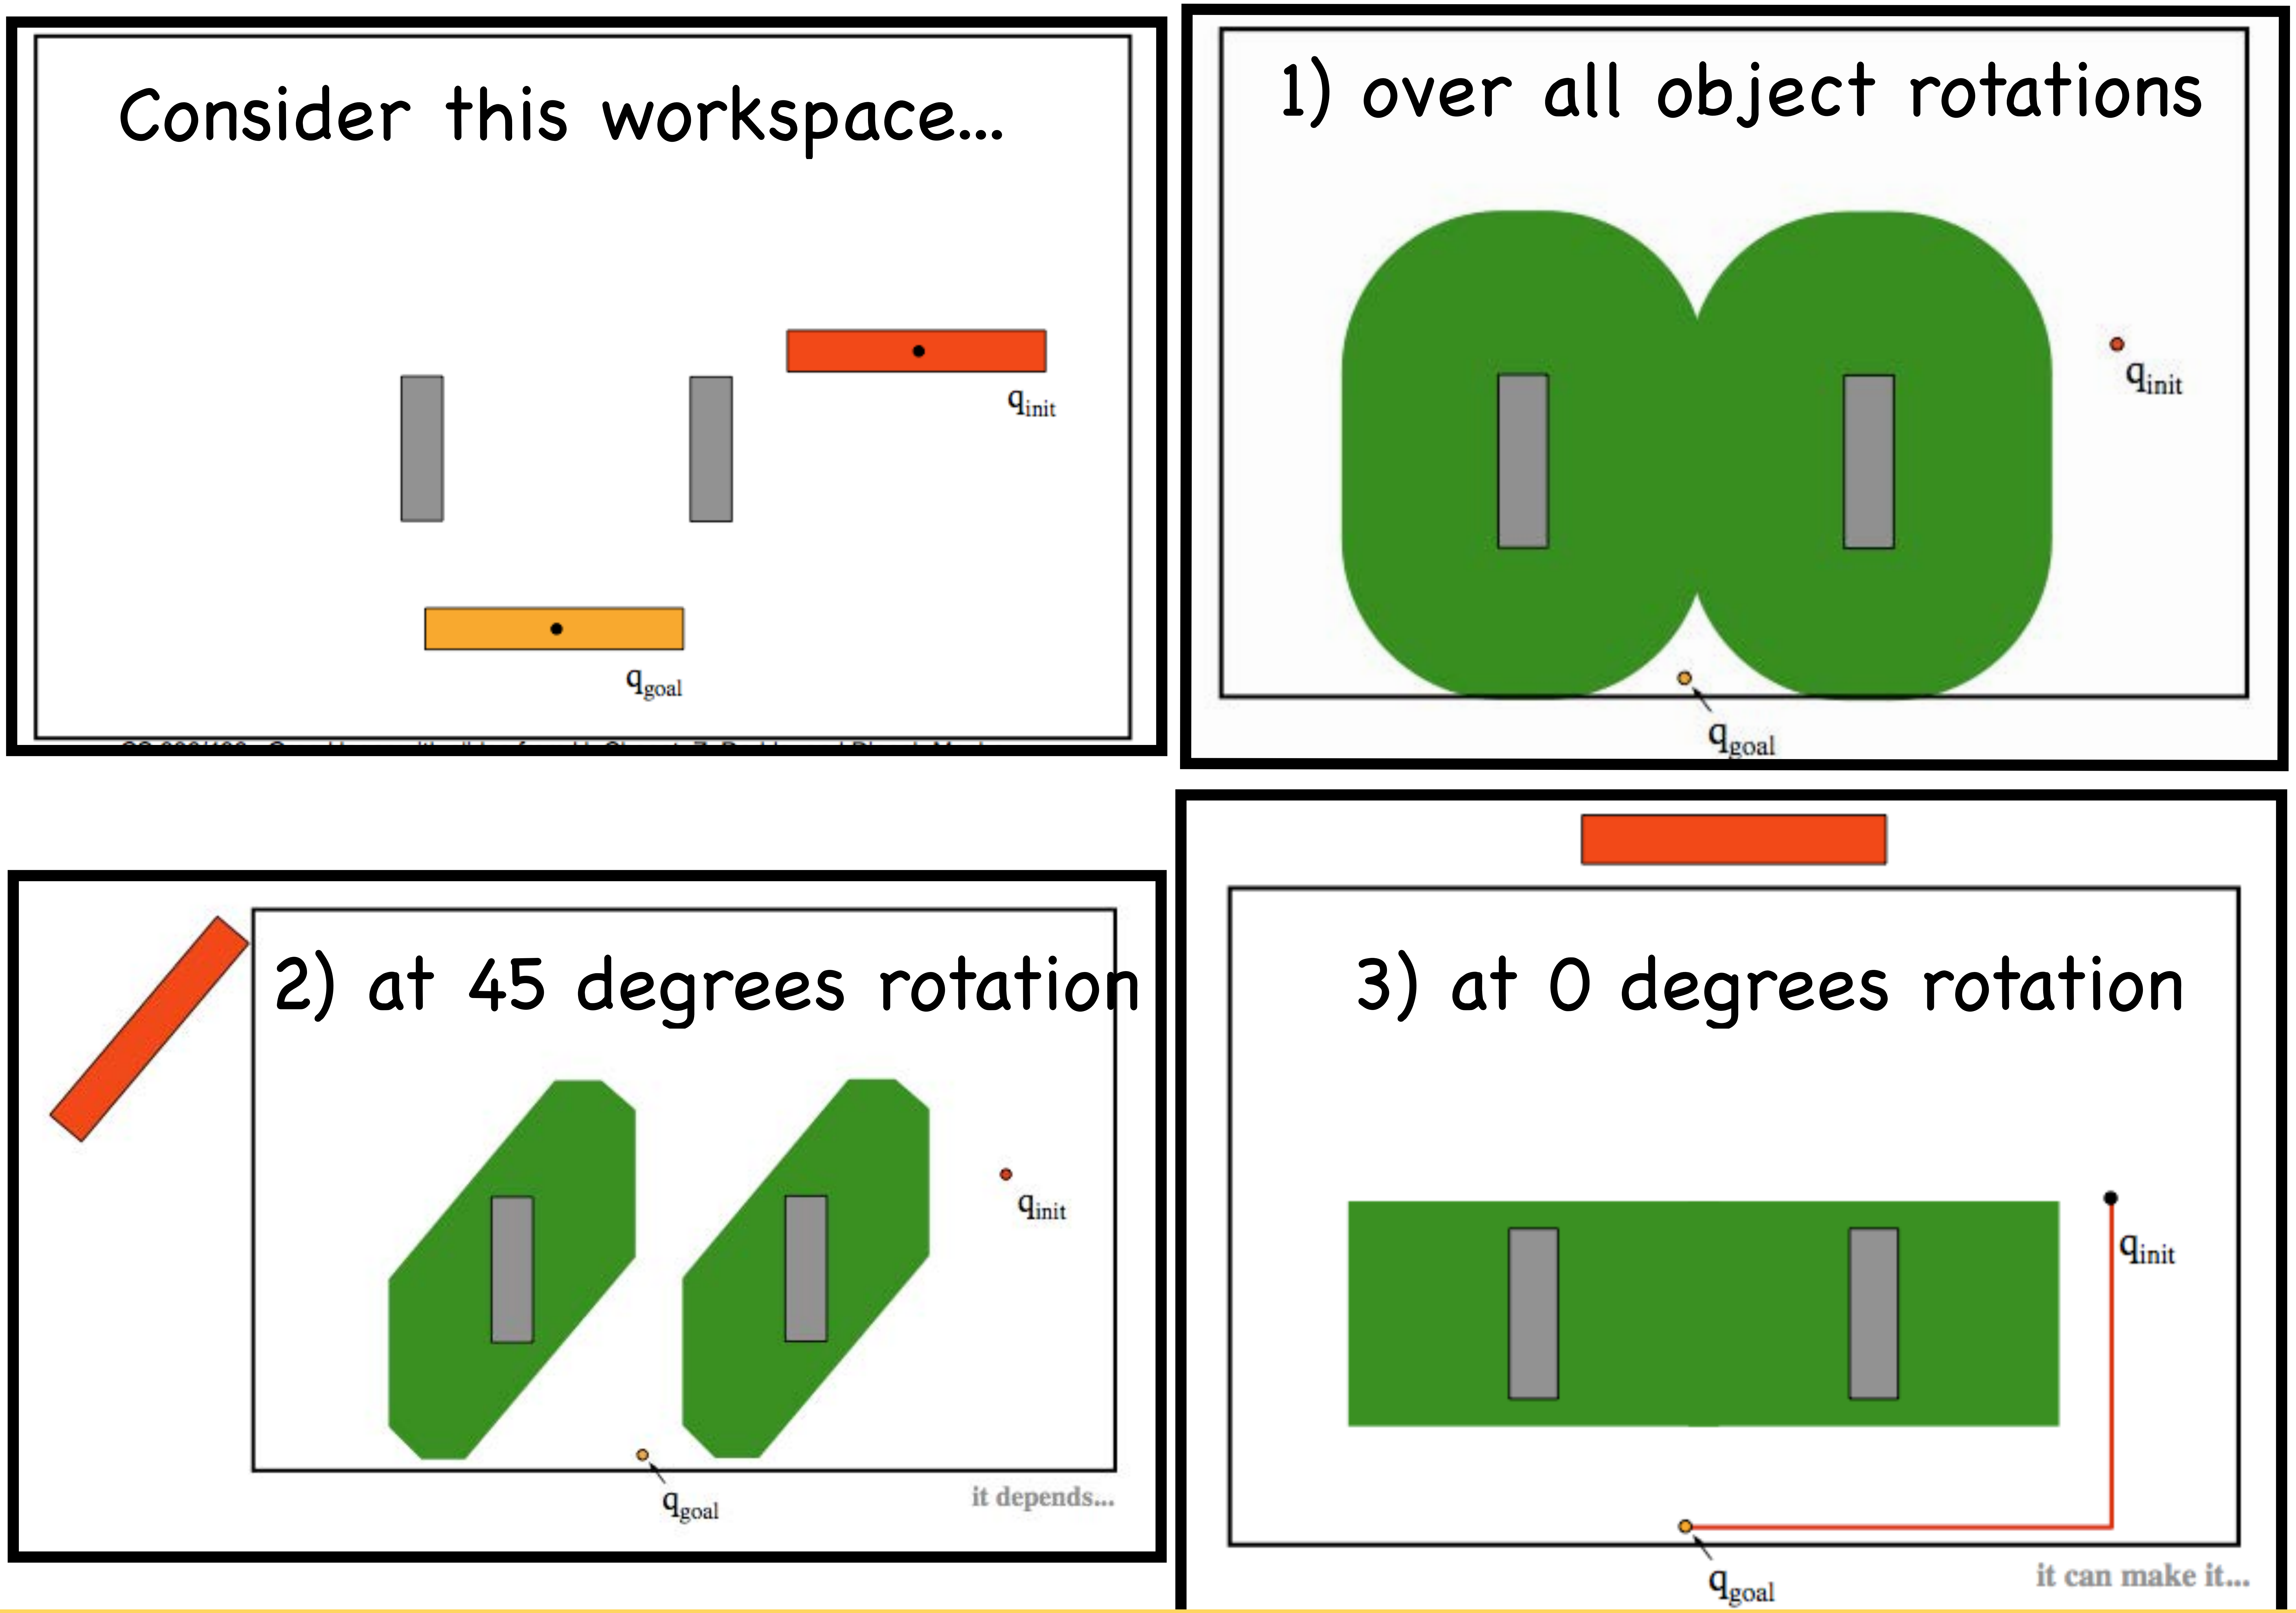




C-space where obstacles are grown with all possible object positions, orientation constrained to 45 degrees
q_{init}
q_{goal}
it depends...



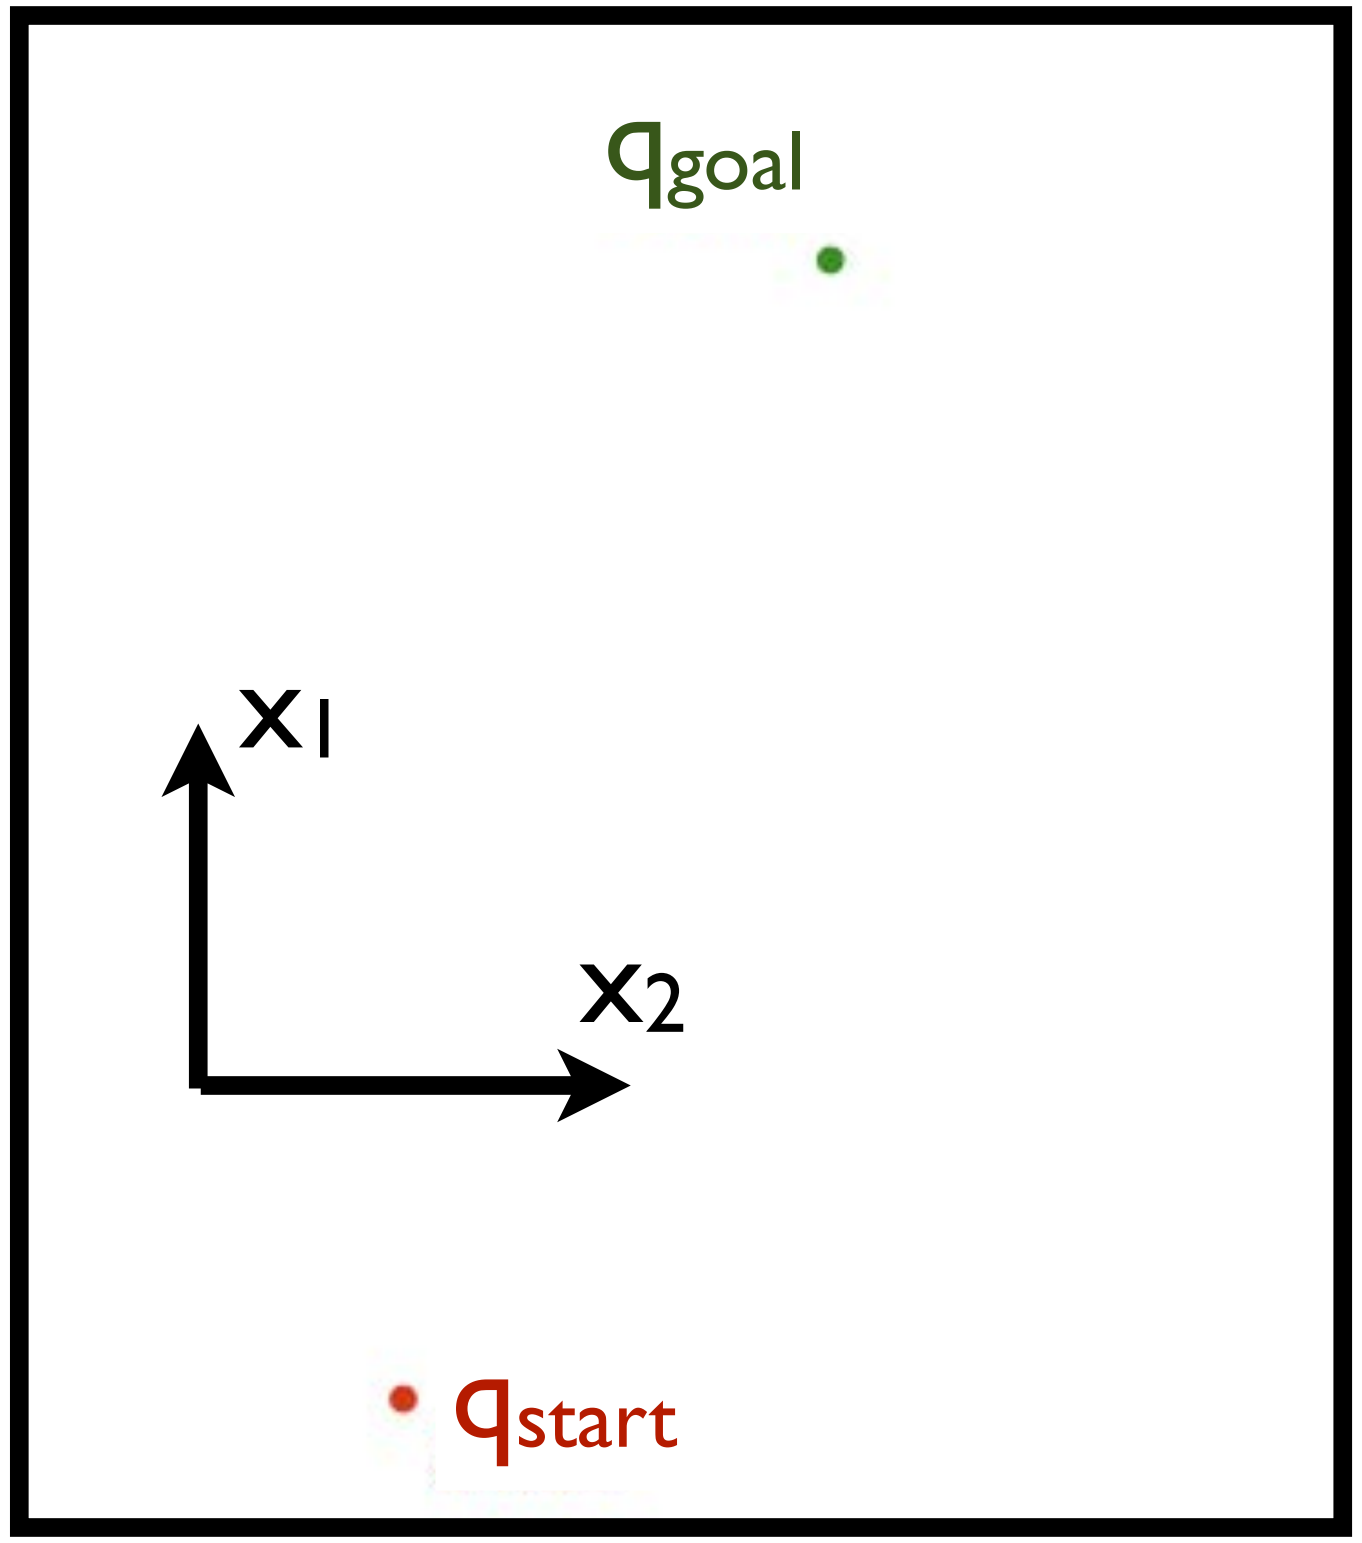
C-space where obstacles are grown with all possible object positions, orientation constrained to 0 degrees
q_{init}
q_{goal}
it can make it...

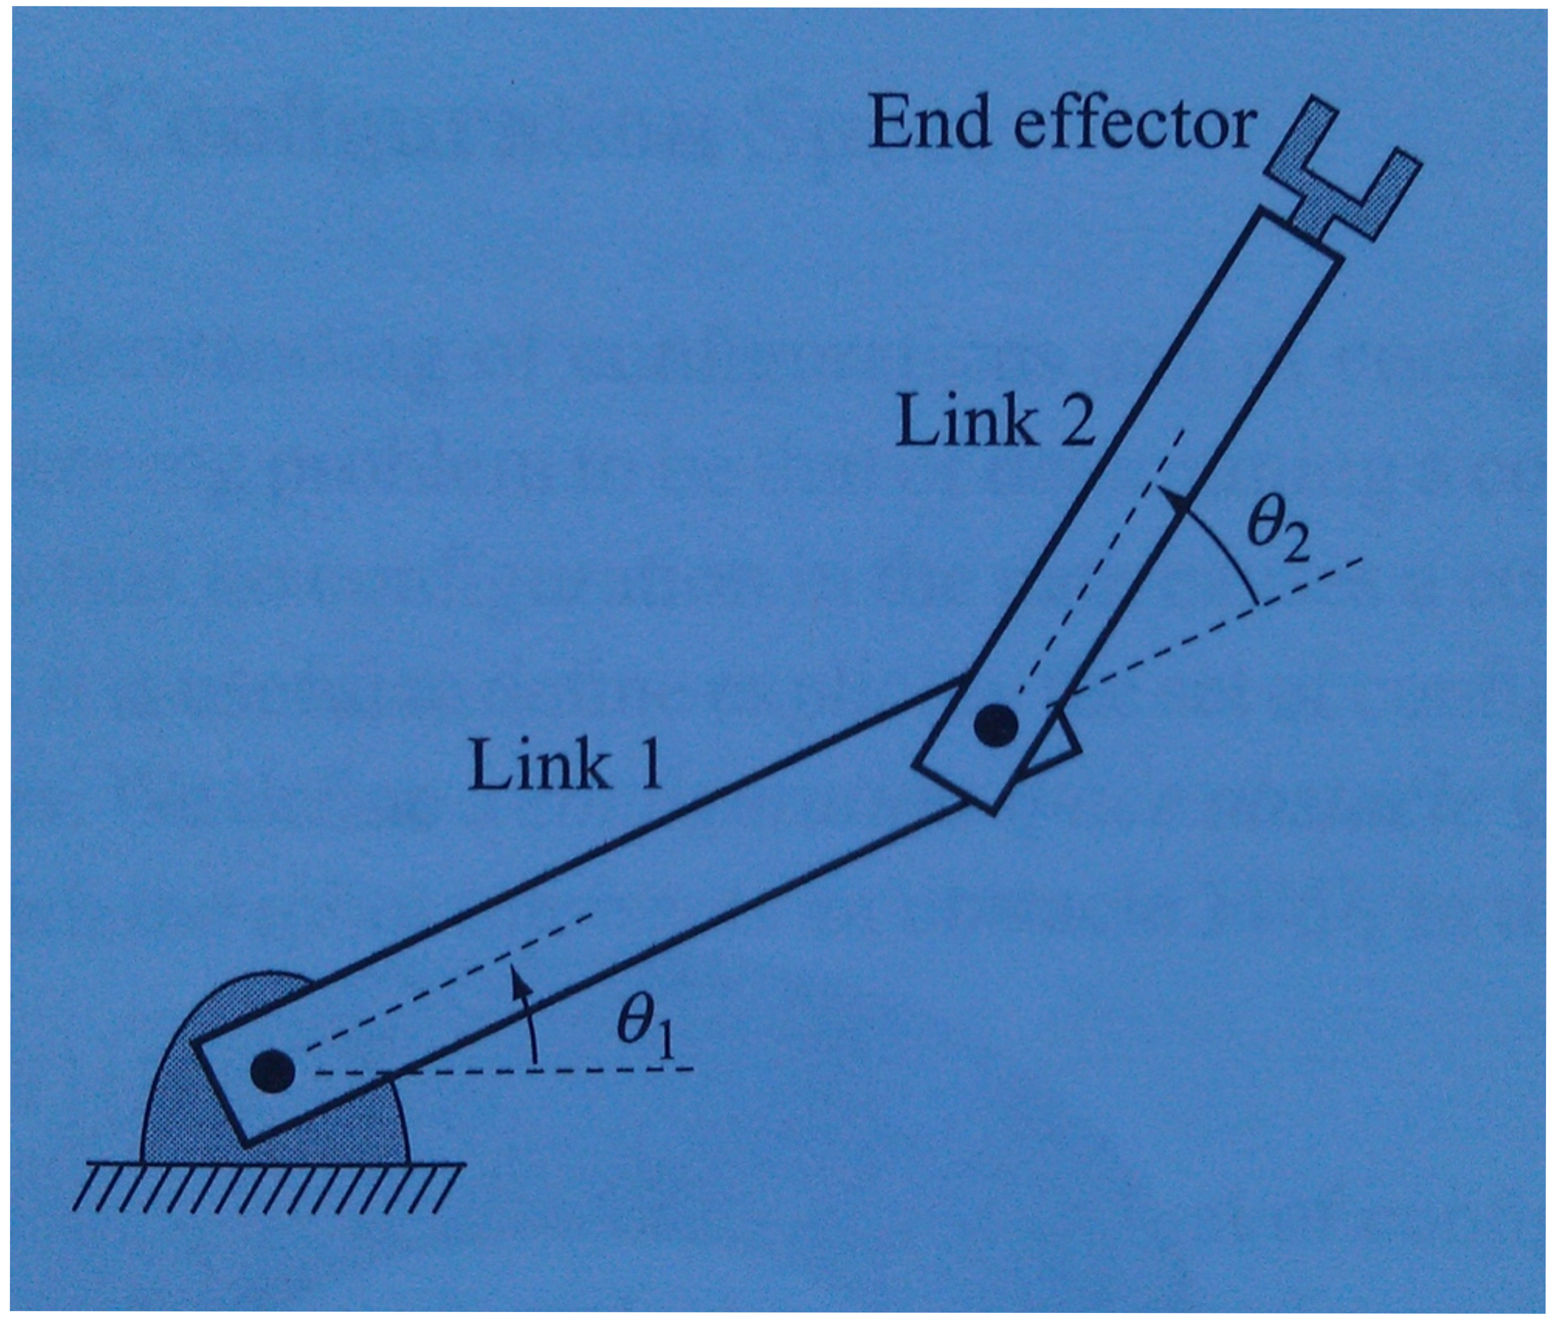


Consider this workspace...
q_{init}
q_{goal}
1) over all object rotations
q_{init}
q_{goal}
2) at 45 degrees rotation
q_{init}
q_{goal}
it depends...
3) at 0 degrees rotation
q_{init}
q_{goal}
it can make it...

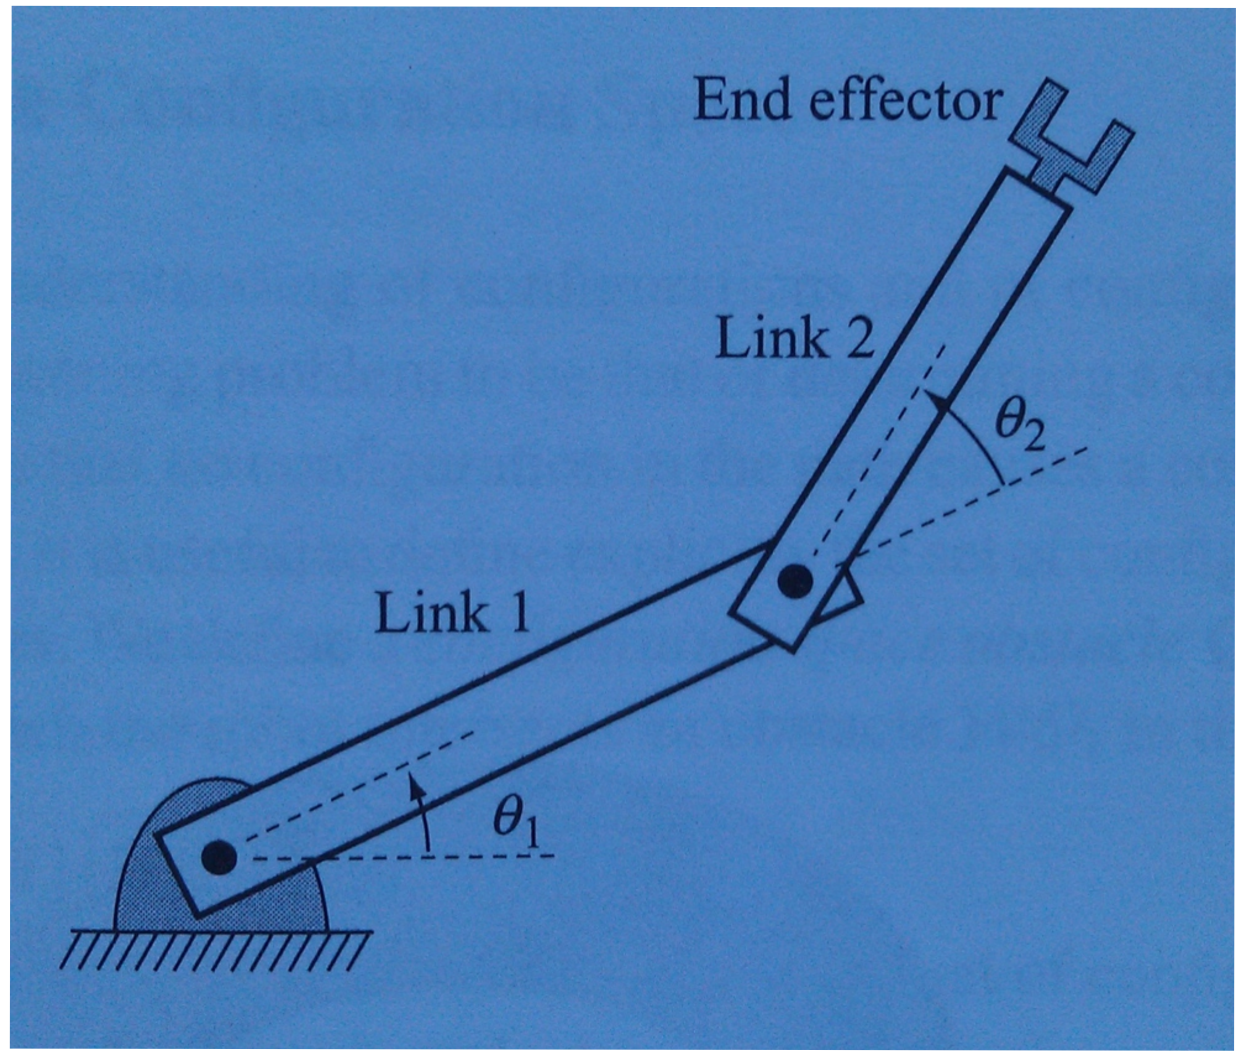
Configuration v. Workspaces

- Other than rotation and geometry, how is the 2-link arm different than the point robot?

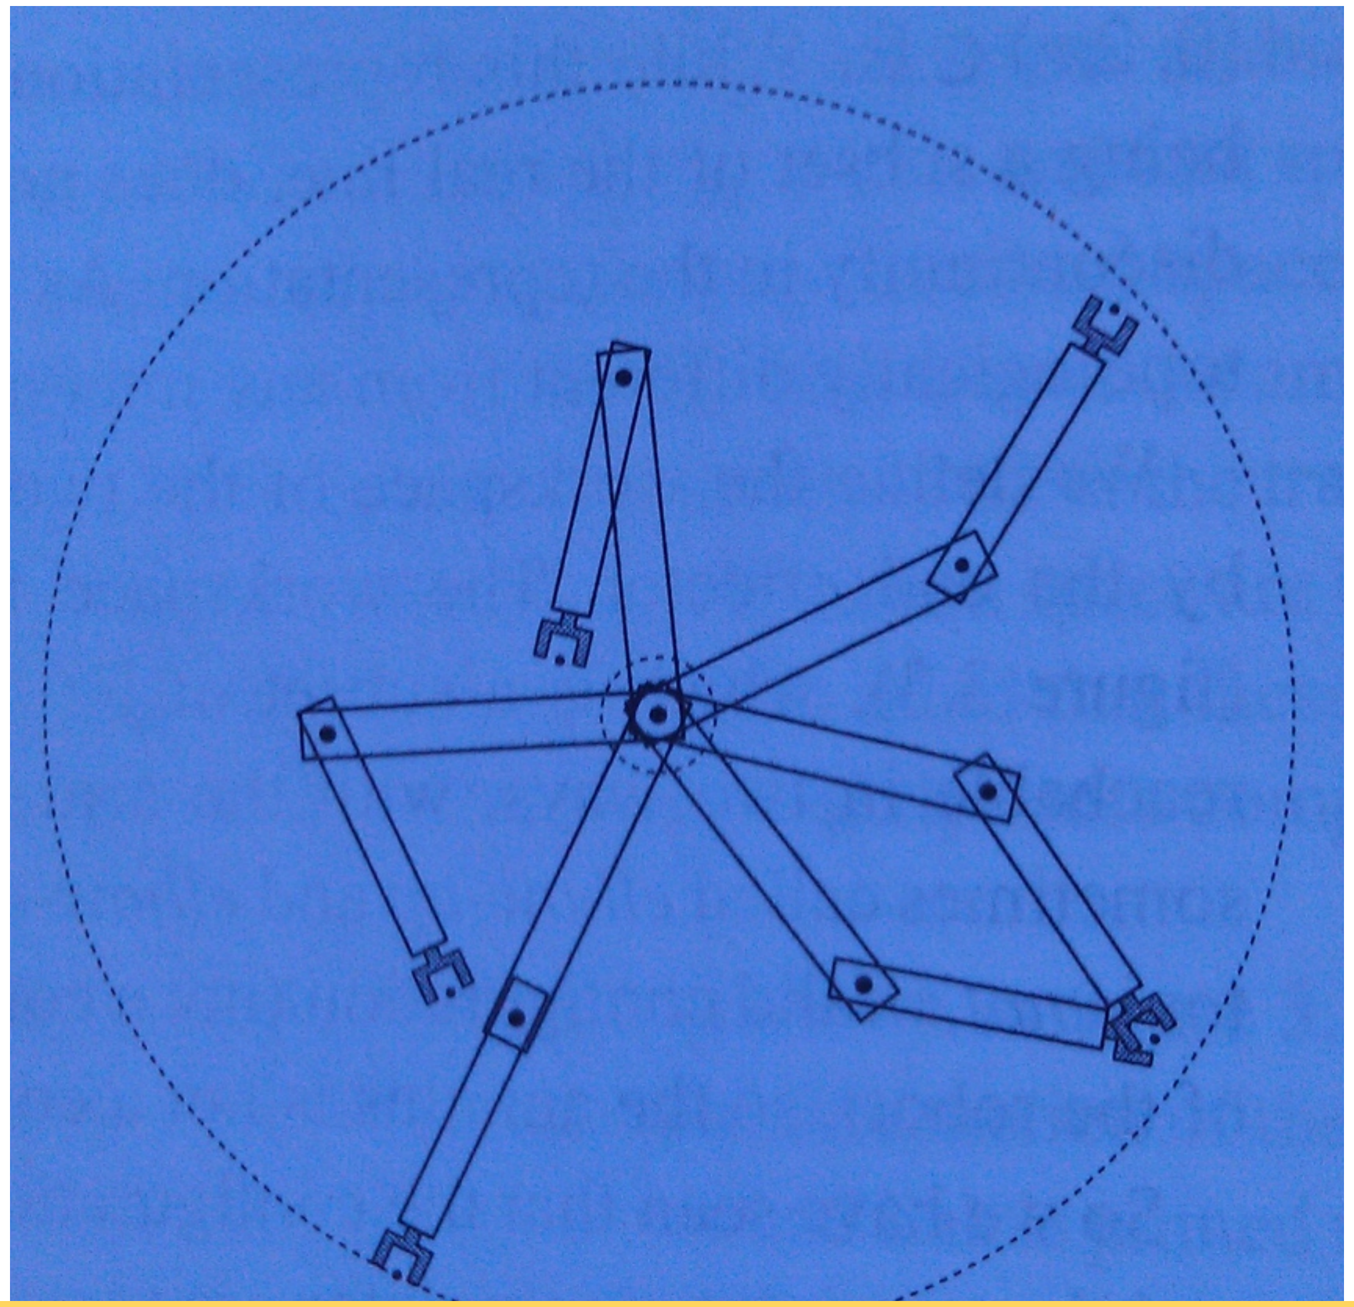




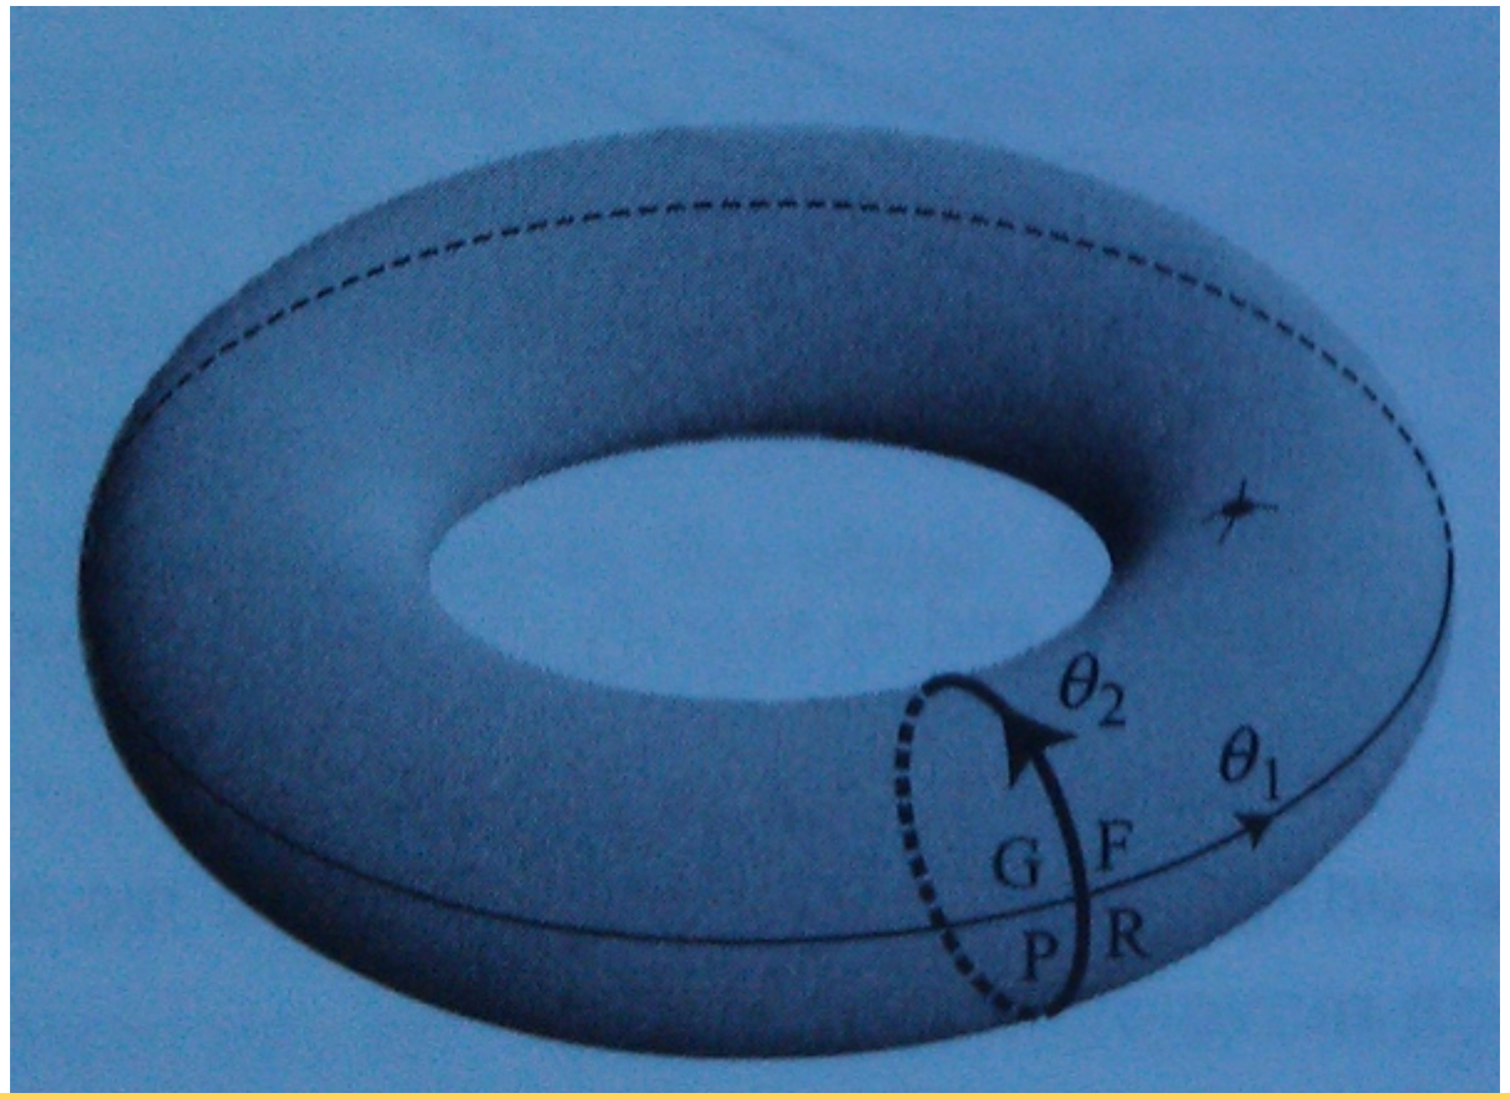
Slide borrowed from Michigan Robotics autorob.org



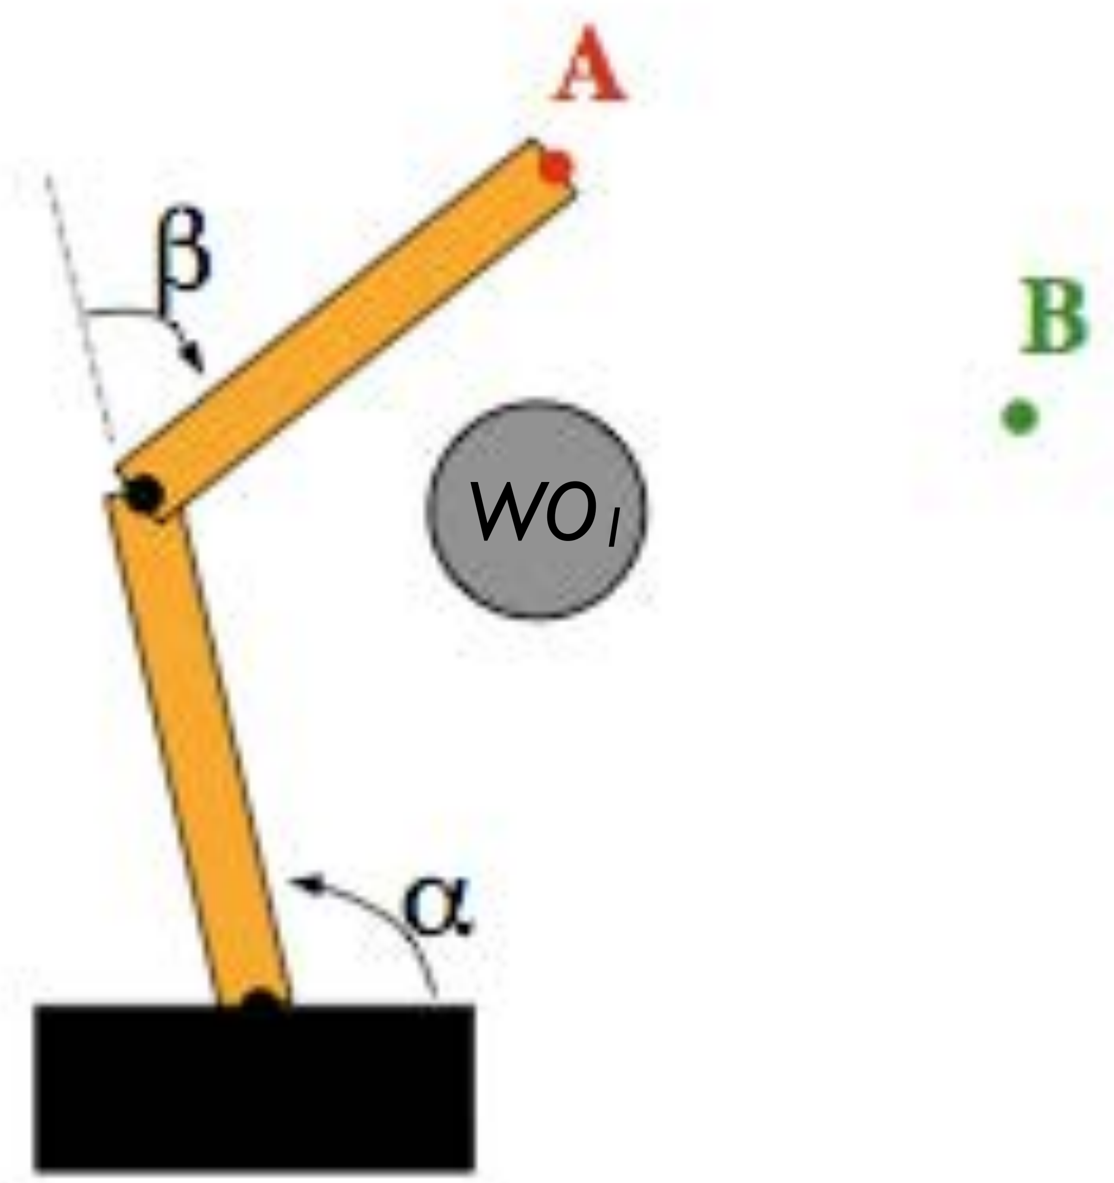
Workspace is w.r.t. end-effector position *(x,y)*



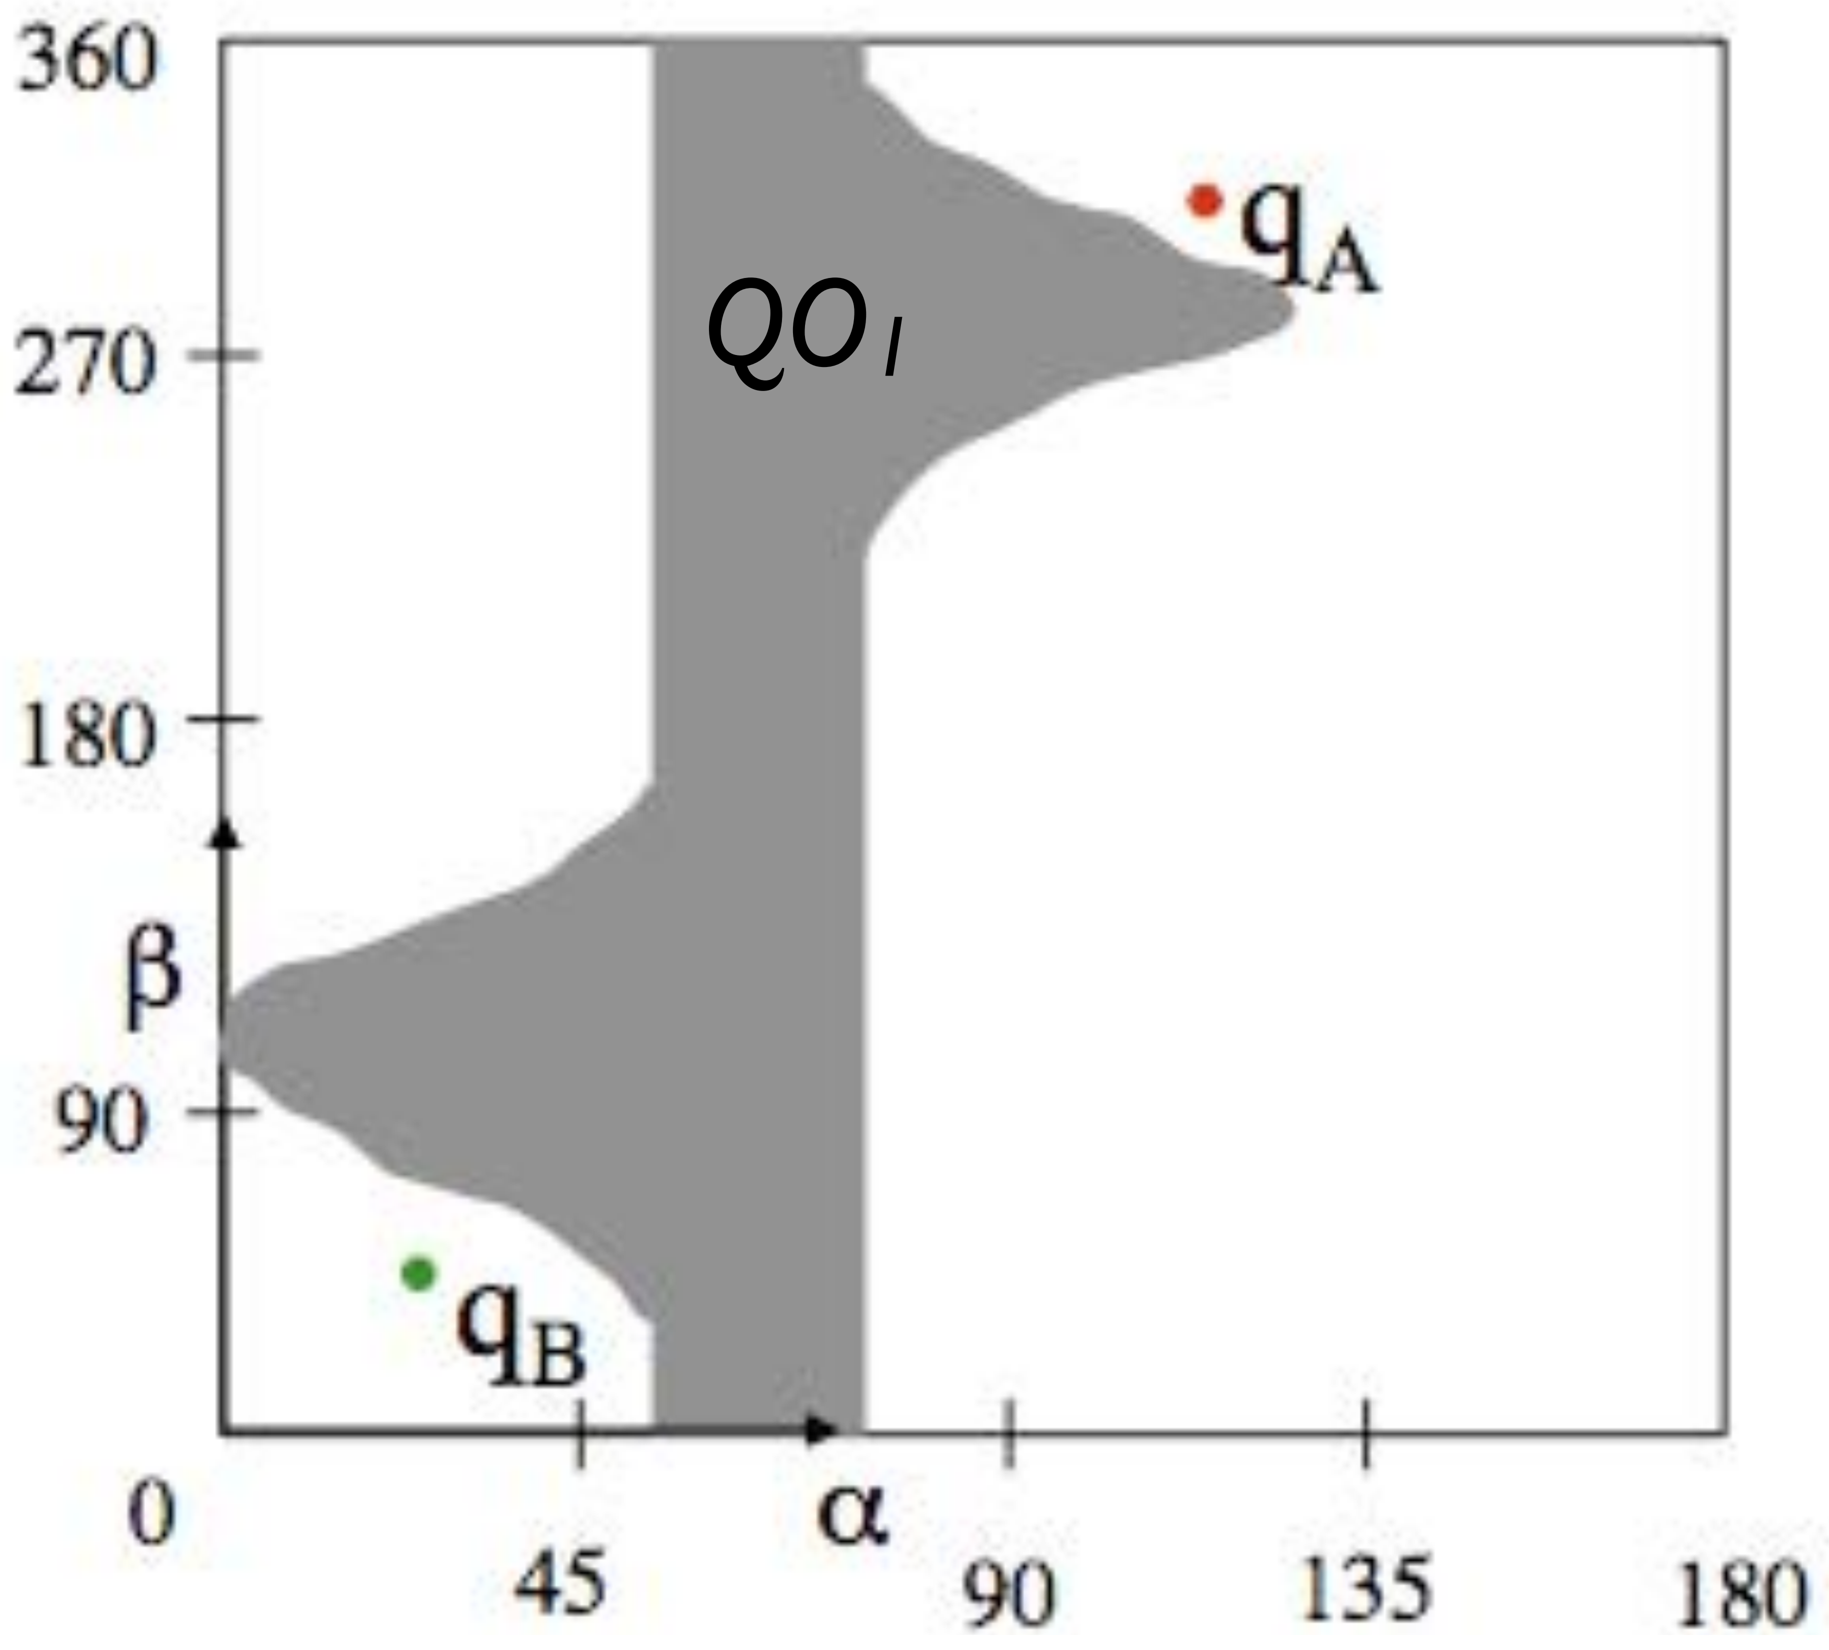
C-space is w.r.t. joint angles (Θ_1, Θ_2)



Obstacles in T^2

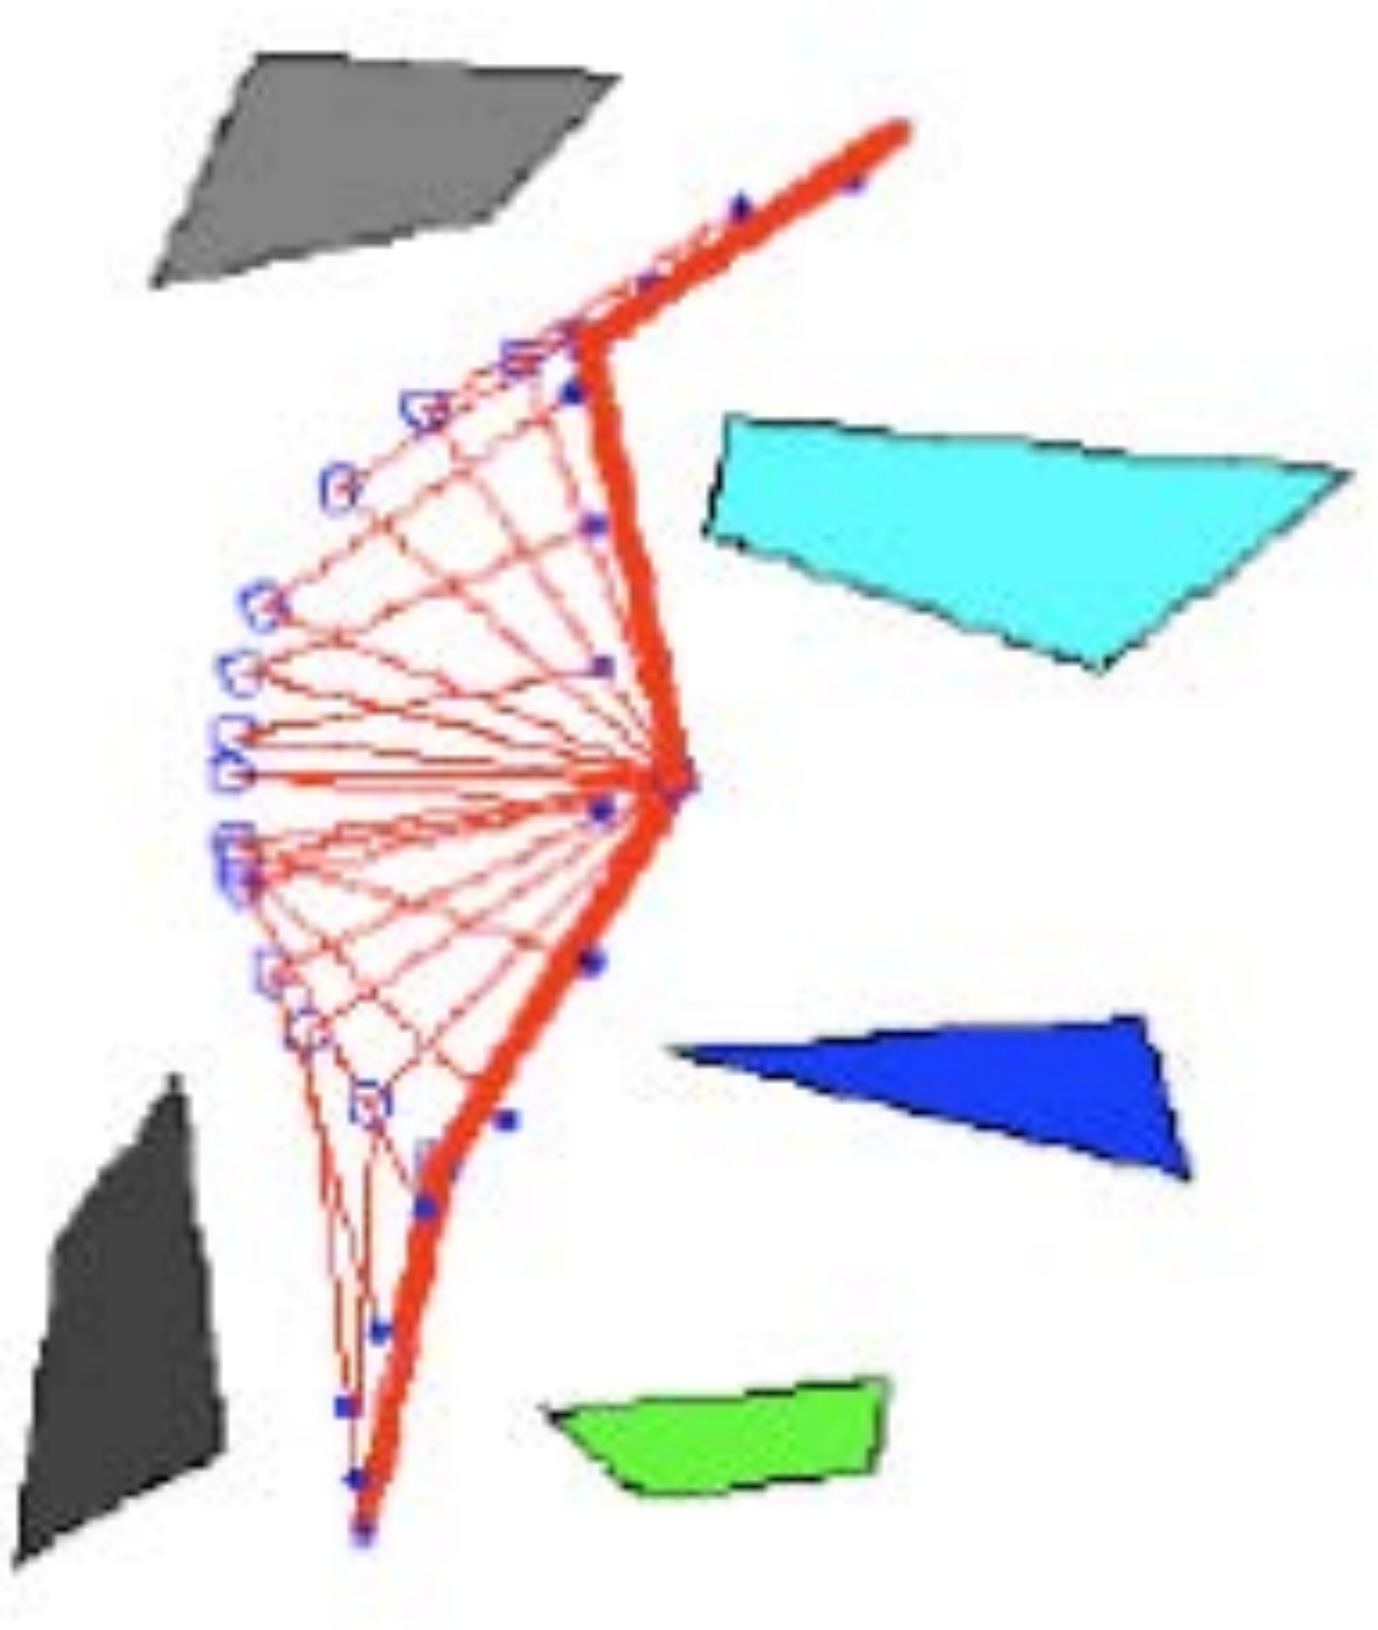


Circular obstacle in workspace

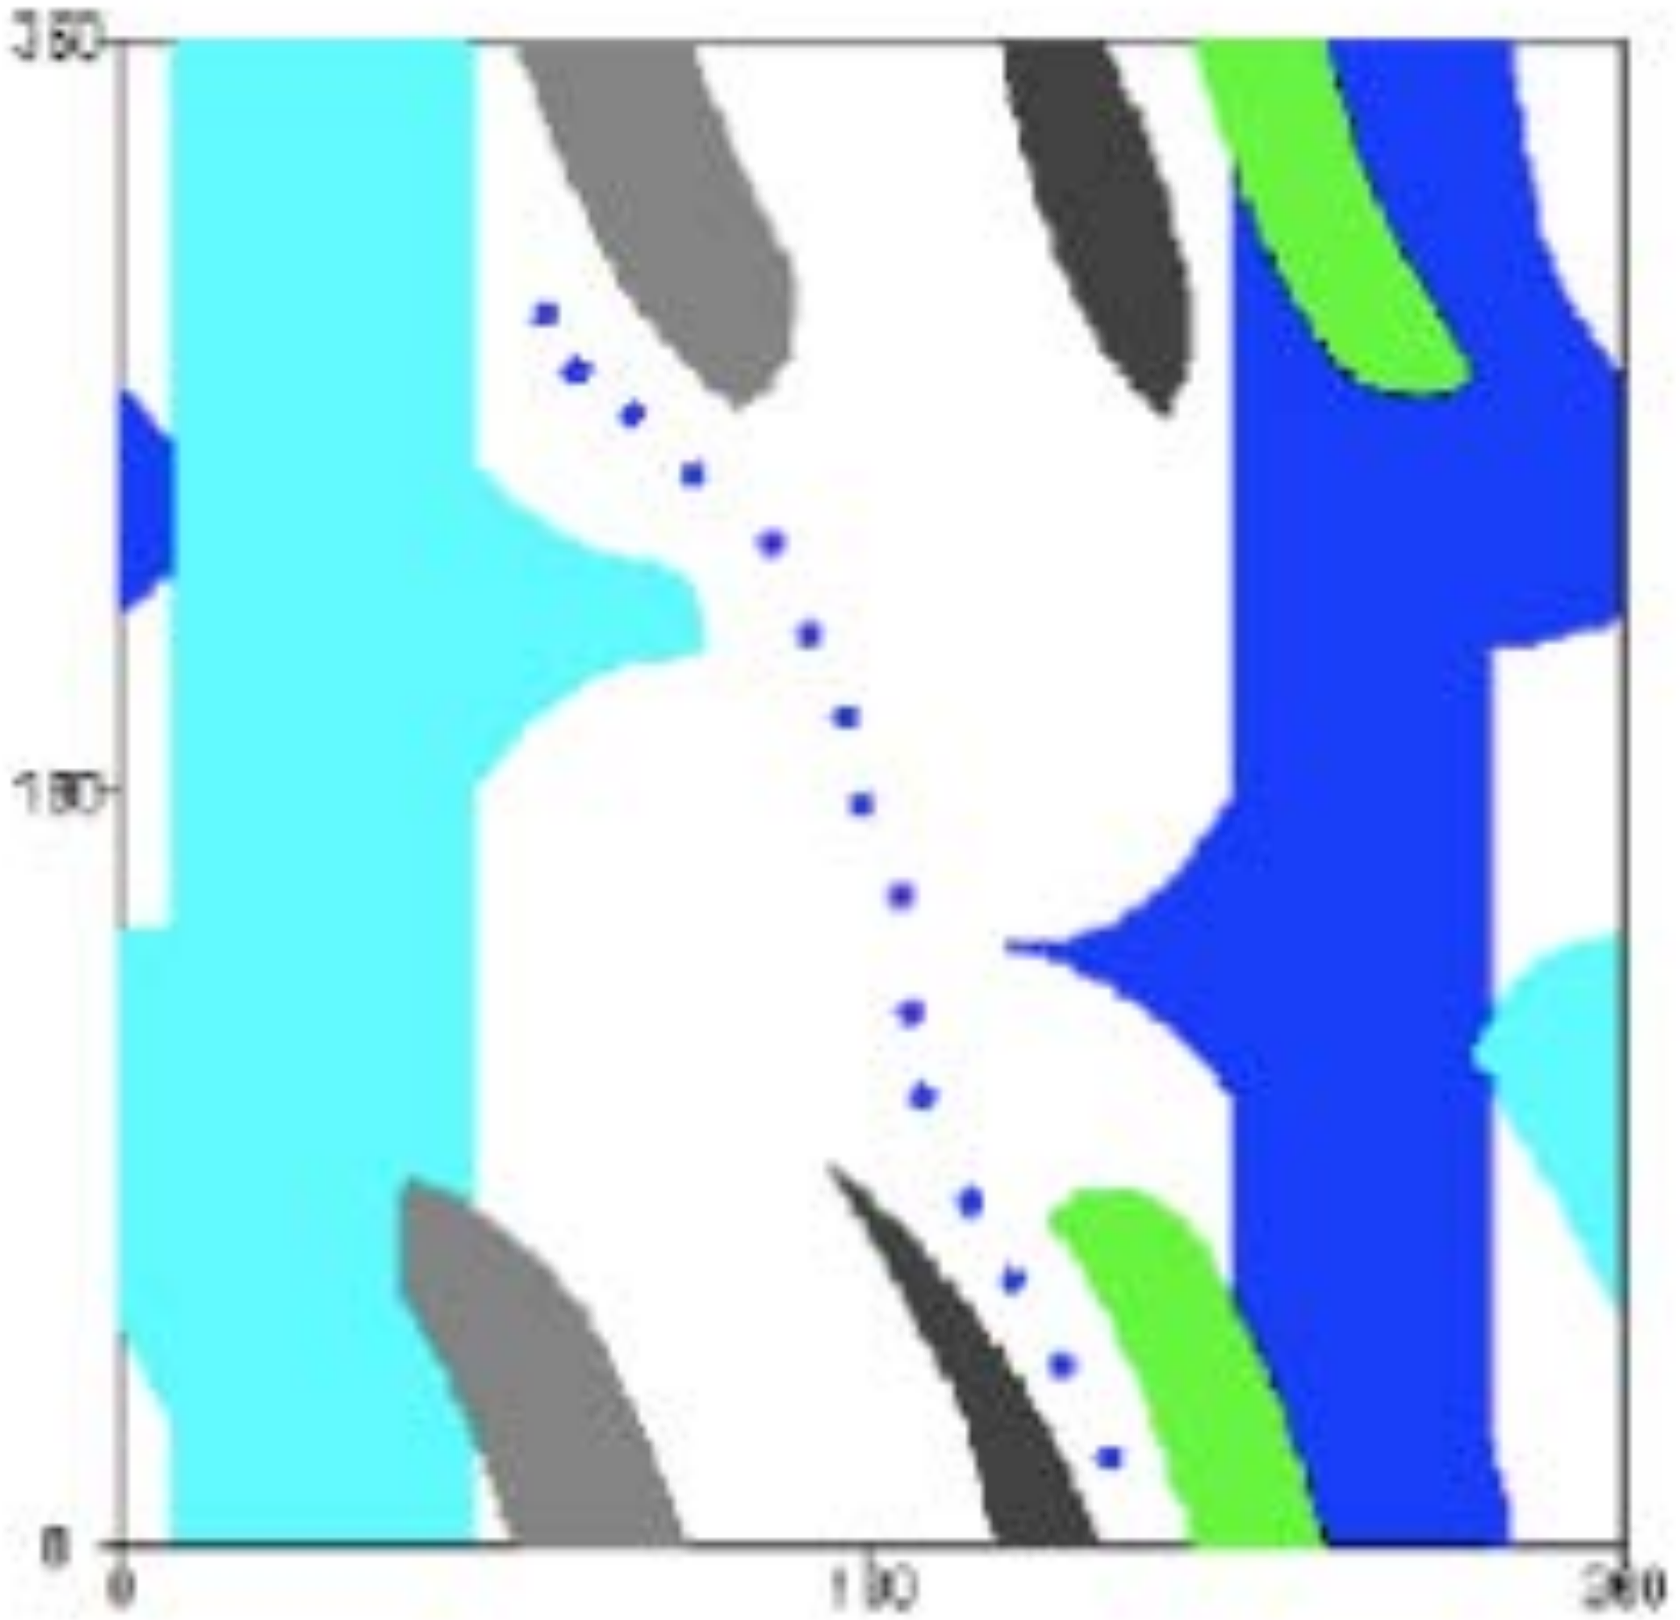


C-space representation

Path in T^2 with several obstacles

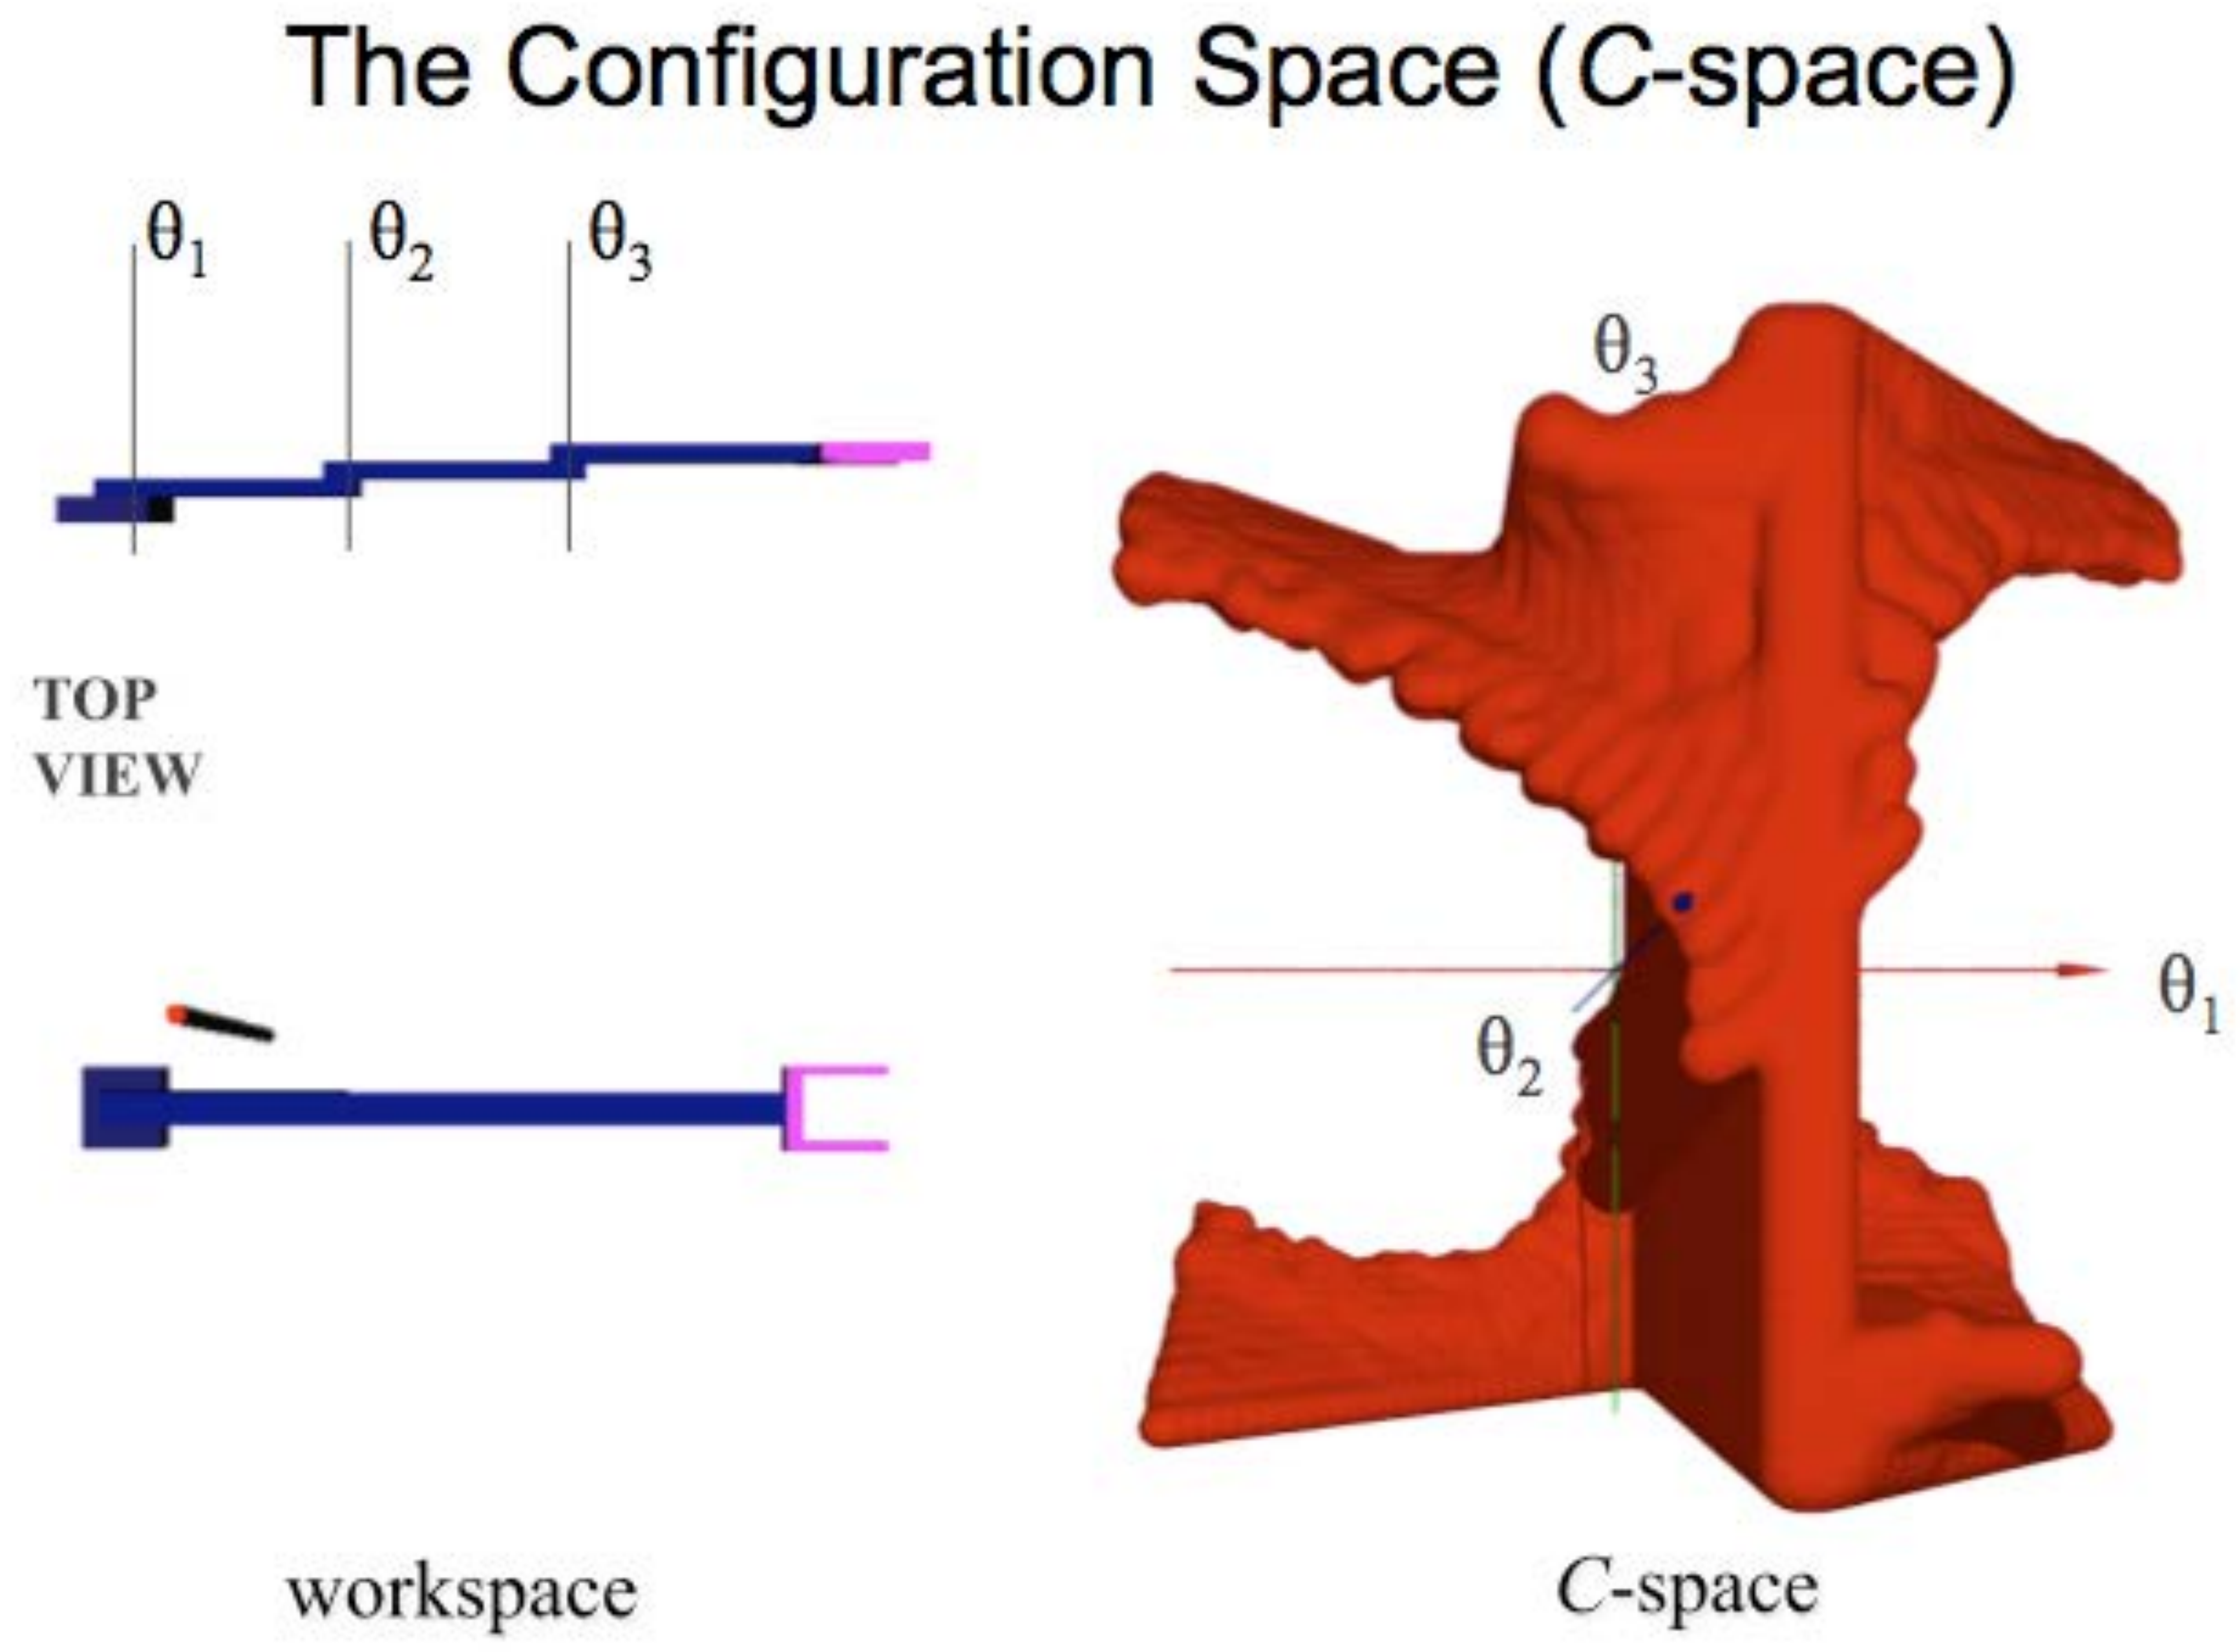


Arm navigation in workspace



C-space representation

C-space for 3-link arm



Generalizing graph search for robot configurations

Costmaps: Graph Search Revisited

- Optimality: Path length vs. Path cost?

- **Costmap** provides weights on graph nodes based on cost factors:
  - Robot motion: joint limits, holonomicity, smoothness
  - Collisions and safety: distance from objects, trajectory predictions
  - Environmental conditions: traversability, slip

Distance Transform

Compute distance of each grid cell to nearest obstacle boundary;
Weight grid cell cost higher if closer to a boundary

A-star shortest path algorithm

all nodes ← {$cost_{start}$ ← infinity, $parent_{start}$ ← none, $visited_{start}$ ← false}

start_node ← {$cost_{start}$ ← 0, $parent_{start}$ ← none, $visited_{start}$ ← true}

visit_queue ← start_node

    while (visit_queue != empty) && current_node != goal

        dequeue: cur_node ← f_score(visit_queue)

        $visited_{cur\_node}$ ← true

        for each nor in not_visited(adjacent(cur_node))

            enqueue: nbr to visit_queue

            if $cost_{nbr}$ > $cost_{cur\_node}$ + cost(nbr)

                $parent_{nbr}$ ← current_node

                $cost_{nbr}$ ← $cost_{cur\_node}$ + cost(nbr)

                f_score ← $cost_{nbr}$ + $line\_distance_{nbr,goal}$

            end if

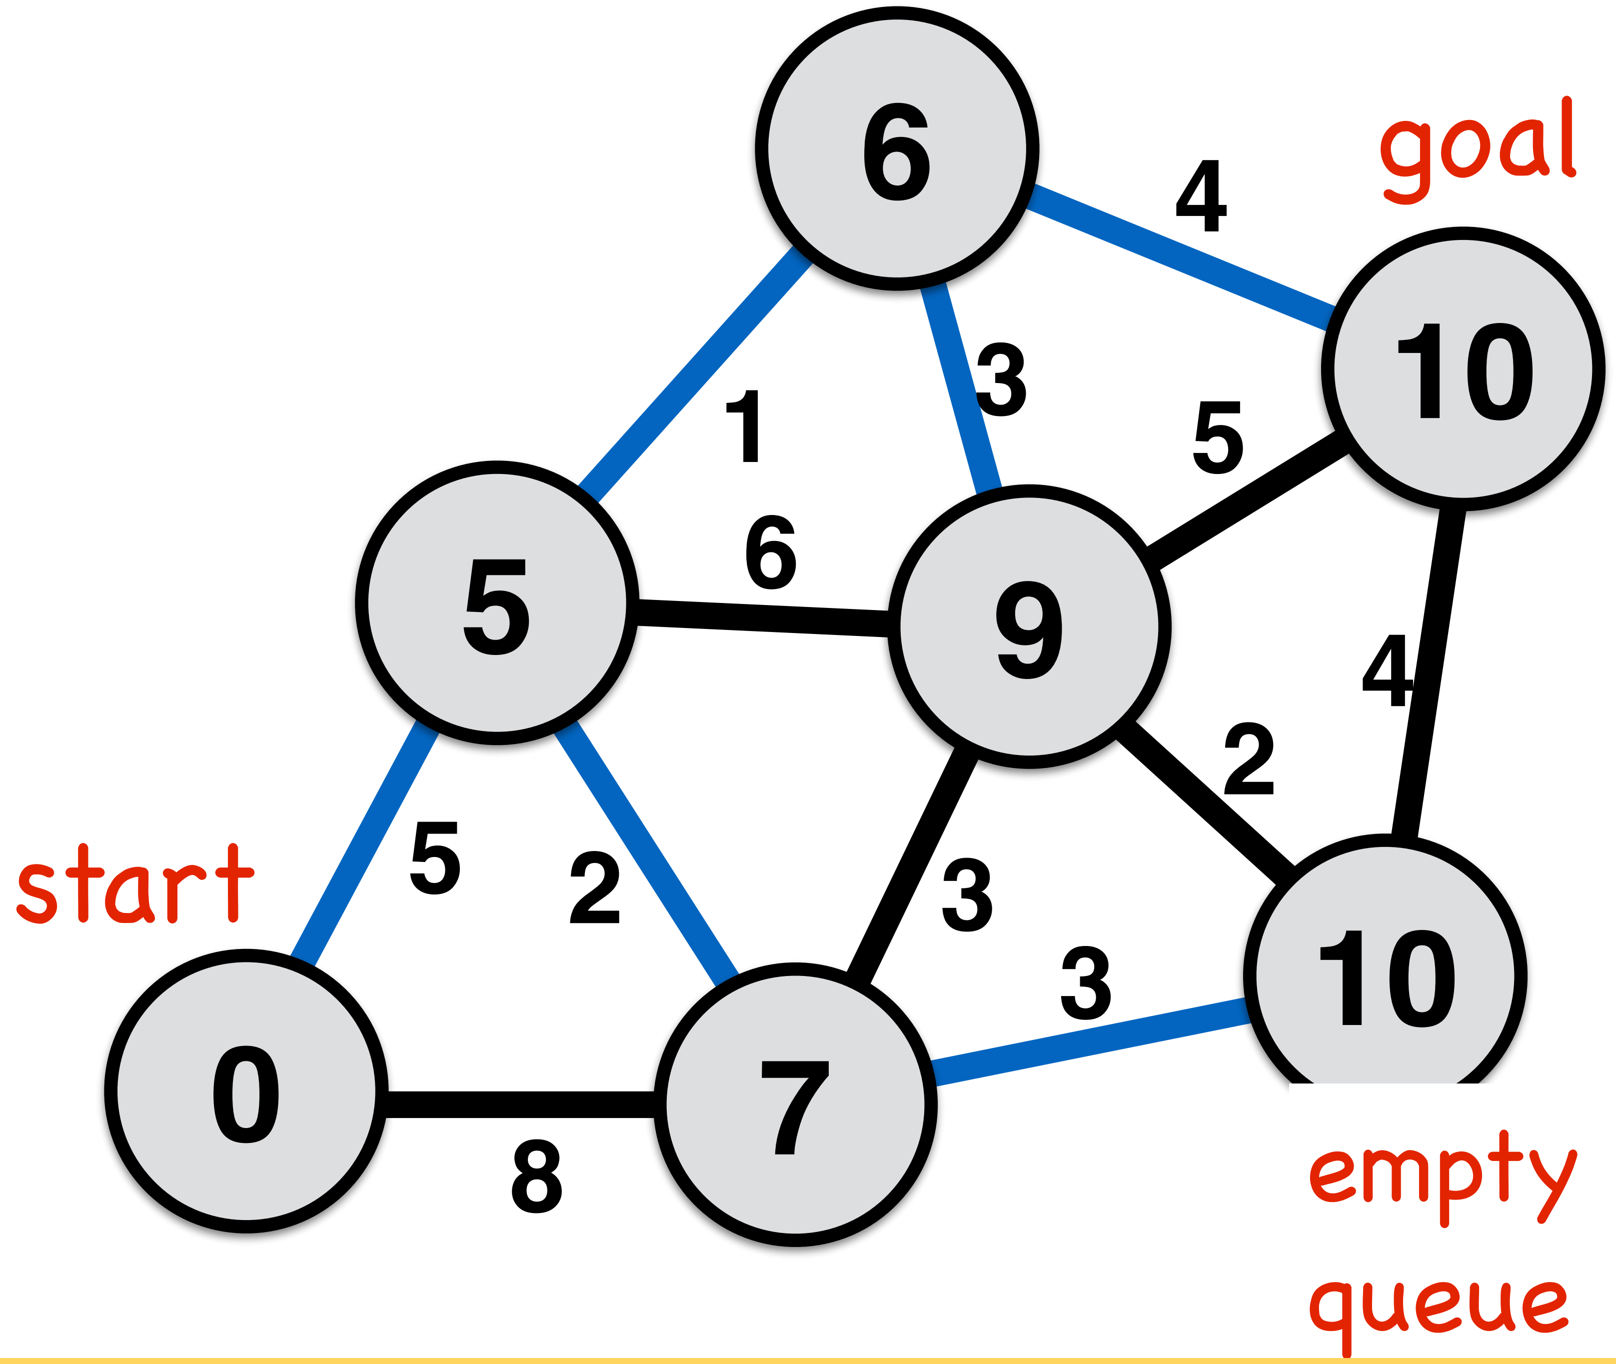
        end for loop

    end while loop

output ← parent, distance

g_score:
cost from start

h_score:
optimistic cost to goal



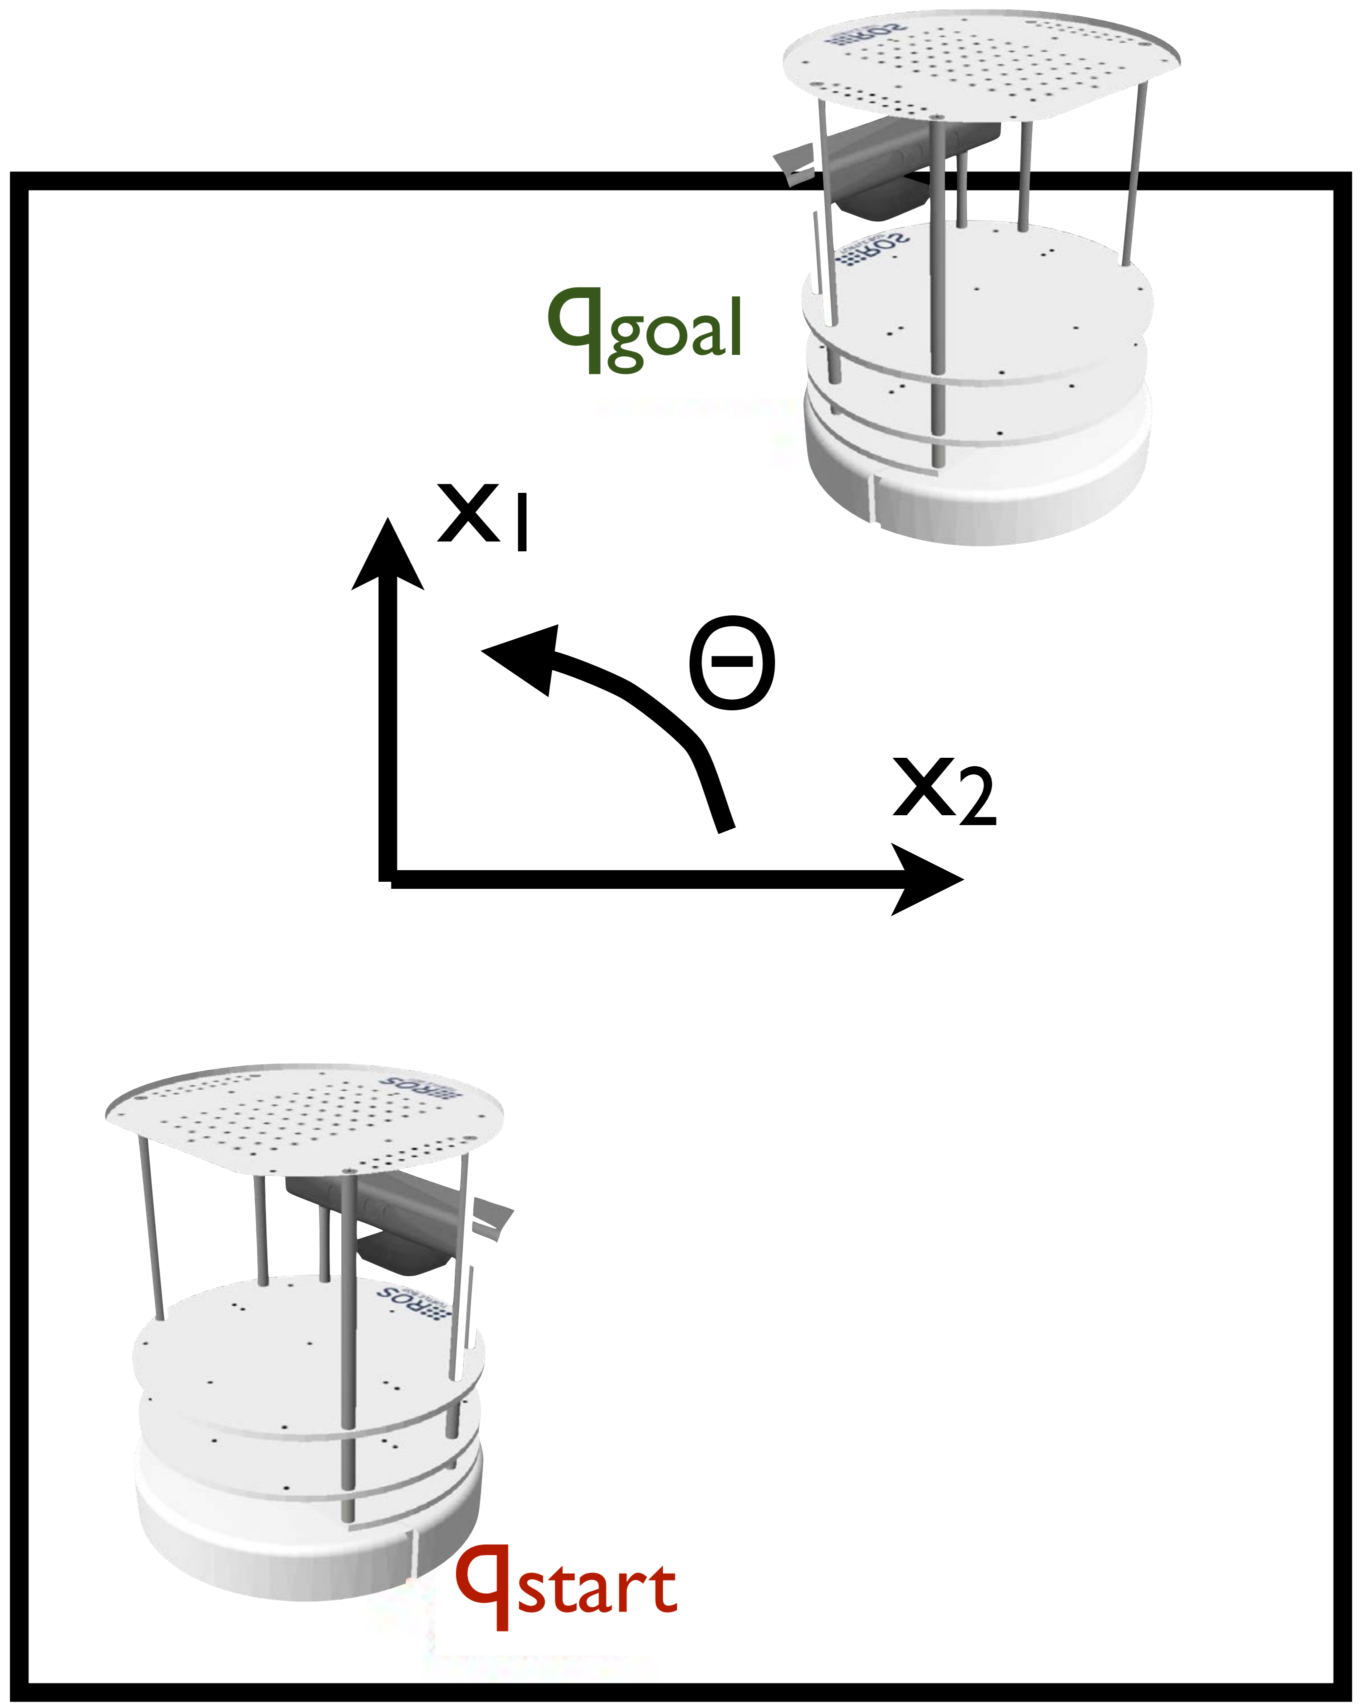
Can a robot move in any direction instantaneously?

Holonomicity

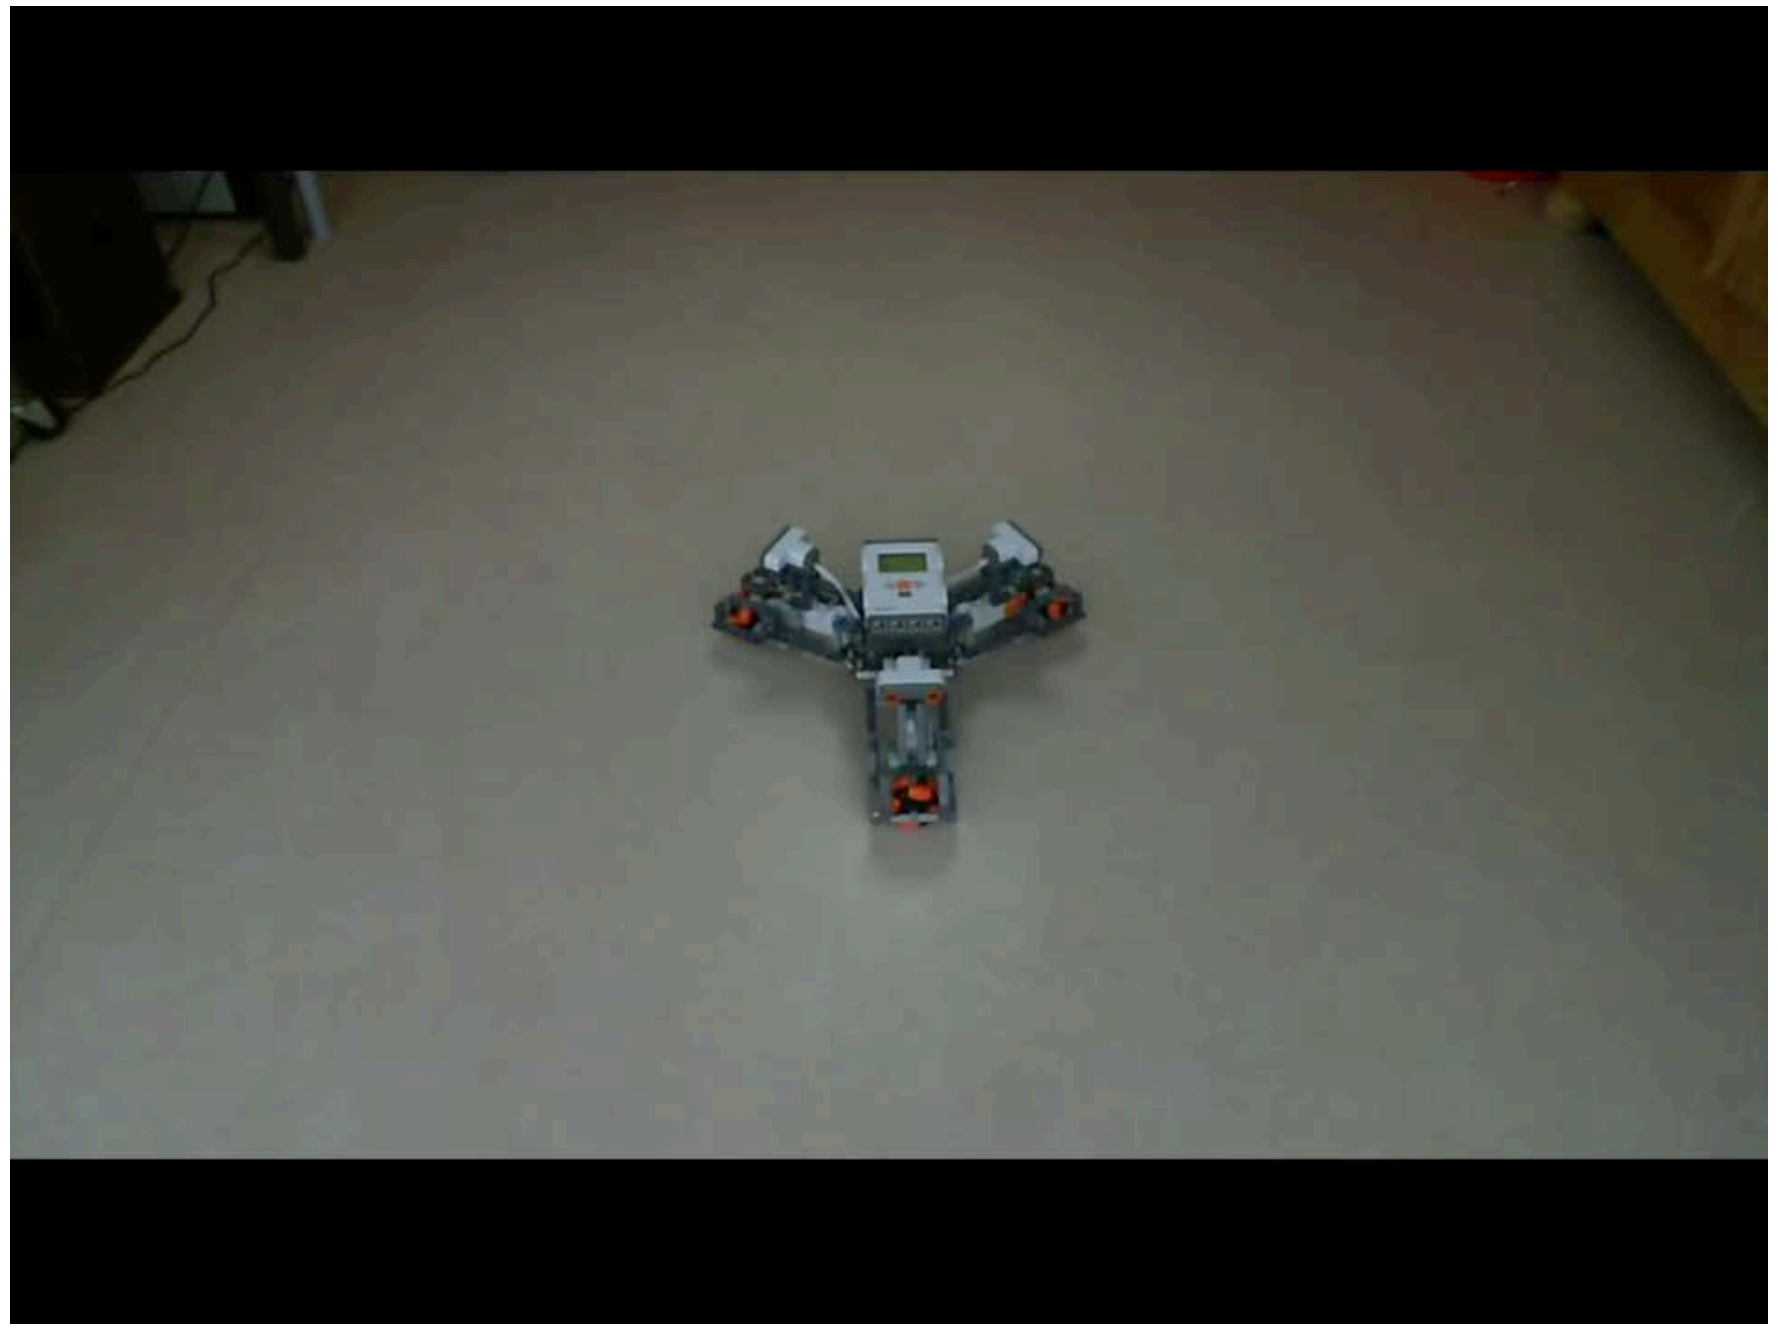
- Does the Turtlebot have 2 DOFs, instead of 3?

- The Turtlebot can only move along 2 axes
  - linear: forward/backward
  - angular: turning

Turtlebot is nonholonomic



Holonomicity



https://www.youtube.com/watch?v=c-lEjVsoiGo

https://www.youtube.com/watch?v=1ak17mdRg5I&t=75s

- A robot is holonomic if it can change its pose instantaneously to move in all directions
- Otherwise, the robot is nonholonomic
